MOLYMERX

Australia's broadest range of software for TRS-80's and SYSTEM 80's

MOLYMERX has the Australian distribution rights for literally hundreds of top grade programs from American, Canadian and British publishers. From games to utilities, from DOS's to Databases, if it's top quality then MOLYMERX almost certainly has it.

Now, MOLYMERX is being distributed in Australia by MICRO-80. To help you chose from the incredibly wide range of programs available, you may purchase a MOLYMERX catalogue. For only \$3.00 you receive over 80 pages of what is virtually an encyclopedia of '80 software plus regular updates for 12 months. The useful information contained in this catalogue is worth many times its cost.

There are now generous BULK BUYING DISCOUNTS of 10% off list price for single orders in excess of \$500 or 15% for single orders in excess of \$1,000. So get together with your friends or User Group members to place a combined order and save yourselves real \$\$\$.

EXPANSION INTERFACES FOR SYSTEM 80 and TRS-80 COMPUTERS

MICRO-80's new family of expansion interfaces for the System 80 and TRS-80 offer unprecendented features and reliability including:

Up to 32K STATIC RAM: to ensure high noise immunity and reliability

Centronics Printer Port: The Systems 80 Expansion Interface has a double-decoded port to respond to both port FD and memory address 37E8H, thus overcoming one of the major incompatabilities with the TRS-80.

RS232 Communications Port: for communicating via modem or direct link to other computers

Single Density Disk Controller: for complete compatability with all Disk Operating Systems

Supports double-sided Disk Drives up to 80 tracks: with a suitable disk operating system such as DOSPLUS, NEWDOS 80 or LDOS, the interface will support single or double sided drives of 35-80 track capacity.

Economical double density: an economical, high quality double-density upgrade will be released shortly to enable you to increase the capacity of your disk drives by 80%.

Real time clock interrupt: provides software clock facility used by most DOS's. AVAILABLE MARCH 1984, price to be announced shortly. Demand is sure to be heavy. Interfaces will be supplied on a first-come-first-served basis. To avoid disappointment you should write in NOW to be included on the no-obligation

waiting list.

SYSTEM 80 PRINTER INTERFACE \$99 + \$3.00 p&p

For those who wish to add a printer to their SYSTEM 80. MICRO-80's new printer interface provides the ideal solution. Double-decoded to both port FD and address 37E8H, this interface overcomes one of the major incompatabilities between the SYSTEM 80 and the TRS-80. Price includes a Centronics printer cable. Operates with Centronics compatible printers including GP-80 and GP-100.

Similar interface is also available for the TRS-80 \$99.00 + \$3.00 p&p

ABOUT MICRO-80

EDITOR: IAN VAGG

MICRO-80 is an international magazine devoted to the Tandy TRS-80 Model 1, Model III and Colour microcomputers, the Dick Smith System 80/Video Genie and the Hitachi Peach. It is available at the following prices:

MAGAZINE ONLY	\$ 36.00	\$ 3.50
CASSETTE SUBSCRIPTION	\$ 96.00	\$ 6.00
DISK SUBSCRIPTION	\$125.00	\$10.00 (disk)
BIGIT GOBGOTIII TIGIT	Ψ120.00	φ10.00 (disk)

MICRO-80 is available in the United Kingdom from:

U.K. SUBSCRIPTION DEPT. 24 Woodhill Park, Pembury, Turnbridge Wells, KENT TN2 4NW MAGAZINE ONLY CASSETTE SUBSCRIPTION £1.50 £16.00 £43 00 £N/A DISK SUBSCRIPTION £75.00 FN/A

MICRO-80 is available in New Zealand from:

Special bulk purchase rates are also available to computer shops etc. Please use the form in this issue to order your copy or subscription.

The purpose of MICRO-80 is to publish software and other information to help you get the most from your TRS-80, System 80/Video Genie or Peach and its peripherals. MICRO-80 is in no way connected with any of the Tandy, Dick Smith or Hitachi organisations.

WE WILL PAY YOU TO PUBLISH YOUR PROGRAMS: Most of the information we publish is provided by our readers, to whom we pay royalties. An application form containing full details of how you can use your microcomputer to earn some extra income is included in every issue.

CONTENT: Each month we publish at least one applications program in BASIC for each of the microcomputers we support. We also publish Utility programs in BASIC and Machine Language. We publish articles on hardware modifications, constructional articles for useful peripherals, articles on programming techniques both in Assembly Language and BASIC, new product reviews for both hardware and software and we printer letters to the Editor.

COPYRIGHT: All the material published in this magazine is under copyright. This means that you must not copy it, except for your own use. This applies to photocopying the magazine itself or making copies of programs on tape or disk

LIABILITY: The programs and other articles in MICRO-80 are published in good faith and we do our utmost to ensure that they function as described. However, no liability can be accepted for the failure of any program or other article to function satisfactorily or for any consequential damages arising from their use for any purpose whatsoever.

MICRO-80 is Registered by Australia Post — Publication No. SBQ2207

EDITORIAL

Welcome to our new-look MICRO-80 magazine. We hope you find the new layout more readable than the old. For those interested in the mechanics of magazine production, our type setting is now being done on a Compugraphic 80 Electronic phototypesetting machine. This is effectively a multi-user computer/word processor which produces its output photographically. The equipment is much state-of-the-art and is another product of the microprocessor revolution. Just in case you think we must have won the lottery, the type setting equipment is not ours but is the property of Formgraphic, a very progressive type setting house located nearby.

Quite apart from making the magazine easier to read, the new type setting fits double the amount of information on each page thus enabling us to reduce the paper used by almost 25% (the Listings still occupy the same space as before). So when future issues look a little slimmer, don't fret, you will still be receiving the same amount of information. The reduction in paper content is aimed at reducing the magazine's production costs. It is now 2 years since the price of MICRO-80 was last set. In that time, production costs have increased dramatically. Even with the reduction in material costs we have now effected, we must reluctantly increase the selling price of MICRO-80. The new rates which become effective immediately, are published on the index page. The price increase is modest and will enable us to continue to improve our magazine and adapt it to meet the changing requirements of our readers. Of course, you will not be required to pay the new rates until your subscription comes up for renewal. Incidentally, we do send Reminder Notices when your subscription nears its expiry

There have been several changes in key staff at MICRO-80. Ryzard Wiwatowski, the Editor for the past 12 months has resigned as has . Charlie Bartlett, the Software Editor for the past 2½ years. Charlie is moving to sunny Queensland. I am sure we all wish both men well in their future careers. Ian Vagg has assumed the role of Editor once more whilst Ed Grigonis who operates a Model 1 system with disk drives and is an active member of the Adelaide Micro Users Group, has become Software Editor. The departure of Ryzard and Charlie caused no small disruption in our production schedule. The result is the issue you are reading now. It is a double-sized issue (after allowing for type setting) and enboth November compasses December 1983 editions. It is also rather late. The delayed production ran us slapbang into the Christmas season and the subsequent annual close down of cur printers. It will take a month or two until we are once more back on schedule so please accept our apologies for any inconvenience caused.

Much has been happening of late in the '80 field. Tandy has announced several new products including a portable Model 4 known as a Model 4P. This is essentially a Model 4 in a more compact package with 9" monitor, half-height disk drives and separate keyboard which all packs away into a large carrying case. The complete unit weighs in at about 12kg and

with 2 disk drives and 64K of RAM sells in the U.S.A. for \$US1,799.00. Since the 4P has not yet been announced in Australia its price here is unknown but will probably be \$2,600-\$2,700, now that the Model 4 itself has been reduced to \$3,000. There seems little doubt that like radios and calculators before them, computers are going to become portable. The main impediment to this process is the and weight of a readable sized display. Once flat screen or large liquid crystal displays become available at a suitable price the desk-top microcomputer as we know it today is certain to become a quaint relic of the past. The only question now seems to be, how quickly will it all happen?

On a less buoyant note, we have heard form a usually reliable source that EACA, the Hong Kong firm that manufactured System 80/Video Genie, has ceased trading altogether. This will mainly affect those System 80/Video Genie owners who are planning to upgrade their systems to include disk drives or a printer, since printer interfaces and expansion interfaces are no longer available. Fortunately, here at MICRO-80 we had already commenced design work on a new expansion interface and also a printer interface, when the news broke. The interfaces will be available for sale towards the end of February 1984. The expansion interface (there is also a TRS-80 version) includes a printer port, RS232 port, floppy disk controller and up to 32K of static RAM. The use of static RAM gives high noise immunity and removes many sensitive timing problems associated with the dynamic RAM used in the early designs. printer interfact is decoded to both port FD (standard System 80Nideo Genie printer port) and also to memory address 37E8H, the address used in the TRS-80 Model 1. In this way Tandy software which drives the printer port directly will operate satisfactorily on the System 80. The expansion interface has the same arrangements for its printer port, too.

The demise of EACA is somewhat symptomatic of the changes taking place in the '80 world. The proliferation of dif-ferent brands of microcomputer, each more dazzling and spectacular than the last, has reduced the total amount of support available for any one brand. In particular, older machines such as the TRS-80/System 80 are suffering badly. There are many fewer organisation catering for these machines and even their original distributors Tandy and Dick Smith have markedly reduced their levels of support in favour of later models or different machines altogether. At the same time, these computers still have a good deal of useful life left in them and there are literally tens of thousands of owners who have a large personal investment in them through acquired knowlede and programs, both written and purchased. We believe that the TRS-80/System 80 computers are far from finished and it is time that owners drew together to assist each other even more as commercial support wanes. MICRO-80 intends to become an even more important focal point for this support. The development of new expansion interfaces for the TRS-80 and the System 80 and the distribution of Molymerx software in Australia are just two of the ways in which we have increased our support for the owners of '80 computers. MICRO-80 itself will also change to better reflect the interests of its readers. We will for the first time encourage the placement of advertisements for relevant products in our magazine. Rates will be much lower than in the general computing magazines so that small, specialist suppliers will be able to afford to advertise. We will shortly launch a New Products column containing information about relevant new products for '80 computers. In these ways, MICRO-80 will become a more complete reference to all things '80 and help maximise the diminishing support. While some of this may not be of great relevance to overseas readers we are sure that the changes in content which are planned will be very appealing.

be very appealing.

Over the years we have received many comments from readers, both positive and negative. Analysis of these comments indicates that whilst the newer computer owners find the material in MICRO-80 to be pretty much what they want, the more experienced owners find fewer articles and programs to suit their tastes. One of the most consistent complaints is that we publish too many games (usually expressed by the disgruntled as, "All you publish is games"). There are two interesting observations to be made here. Firstly, we do publish many other types of programs besides games. Secondly, the programs we publish represent a fair cross-section of those being written (and presumably used) by Readers so we are probably catering to the "average" taste. That said, we accept that we do not publish many "Senous" programs in terms of relatively complex applications such as Accounting Systems, Data Management etc. Certainly, those of our critics who suggest we should publish full-featured working accounting systems for example, are being somewhat unreasonable. Such software sells for \$2,000 or more. It seems a little much to expect to be given it for the price of a magazine subscription The reason these programs cost so much is the very considerable amount of work, often amounting to man-years, required to write, test, debug and maintain them. Speaking personally, if it were my business at stake, I would make sure that I paid the full rate for a properly supported program because, when things go wrong I want them fixed quickly. Nevertheless, there is considerable scope to increase our coverage in the serious applications area. We will therefore, introduce a number of changes over the next few issues. Firstly, we will support two data base programs, the Tandy Profile series and ENbase from Southern Software. The first because they are useful programs that are very widely used, the second because we believe ENbase to be the most powerful data base available for the '80 computers. Our support will take the form of articles to assist you to understand the concepts behind the programs and how to get the best form them and also "Listings" of specific applications which you can use just as you would a BASIC program. We would welcome (and pay for!) submissions by our readers.

In a similar vein, we will support VISICALC and SUPER VISICALC with articles, templates etc.

We will publish more in-depth reviews of serious applications software such as word processors, graph generators, data bases etc. Games playing can also be a serious business for the real enthusiast so Ed Grigonis has undertaken to write a series of detailed reviews on many of the better quality games. Ed's first contribution on the Adventure System is in this issue from which you will see that he writes very high standard reviews indeed.

One of the more neglected fields in computer magazines of all kinds, is that of utilising the graphics capababilities of dot-matrix printers. The ubiquitious Epson

MX-80 has spawned a host of cheap compatibles in it's wake. There seems to have been few articles published anywhere to assist the owner unravel the Jinglish in the instruction manuals, let alone make use of the extremely versatile bit-graphics capabilities of these printers. MICRO-80 will attempt to rectify these omissions by publishing articles, programs etc which will assist the very many owners of such printers to improve their usefulness.

Even with the increased emphasis on "Serious" computing planned, we will not neglect our less experienced readers and will continue to provide articles and programs to suit the new and intermediate We hope you will find reading our "New-Look" MICRO-80 as exciting and interesting as we find the prospect of producing it. We believe that, whatever your background and experience, each issue will contain something to interest and challenge you.

DEPARTMENTS KALENASCOPE

A major drawback in using the high resolution screen on the Colour Computer is the difficulty encountered when you try to mix the text with the graphics. One way of solving this problem was presented in last month's issue, but the WRITER pro-gram in this issue by Geoffrey Williamson demonstrates a much more flexible and useful solution to the problem. Those of you with Tandy's Editor/Assembler Plus who wish to type in the source code from the magazine will notice that a 'few lines have been left out between lines 1500 and 12,040. This omission is quite deliberate and in the interest of saving space — the source lines omitted are simply the multitude of FCB's that define the bytes of the character table and these can be just as easily read from the Hex Dump. For reference, source line 1410 corresponds to the Hex Dump at \$30CO. For those of you entering the Hex Dump, the memory addresses commencing at \$3000 are only a suggestion since you cannot place the code starting at zero in reserved RAM. However, the program is written in position independent code and you can locate the program anywhere you find it convenient.

WATCH BASIC AT WORK

Normally, the text video display memory on the Colour Computer is located at \$400-\$5FF. The actual values stored here determine which characters are displayed on the screen of your T.V. set. However, the combination of SAM and VDG potentially allow you to set the location of display memory to anywhere in memory aligned on a 512 byte boundary. For those of you who are interested in how a BASIC program or the interpreter itself works, this capacity provides a rather uniaue opportunity for visual demonstration.
In the September '83 issue, the

piece on conserving memory mentioned the frivolous and extravagant use of the CLEARed string space by the BASIC interpreter. The following program provides a graphic illustraiton of how the string

space is managed by the BASIC interpreter.

The program, first of all, reserves some high memory for a machine language subroutine and POKEs it into memory. The subroutine modifies the display offset register in the SAM chip and allow you to display any portion of the 16K RAM. The routine is called in line 40 and sets the display memory to addresses \$300 — \$3FF (in fact, any parameter in this range would set the display to this page of memory). Lines 50 to 70 do some string manipulation which you can watch on your screen (the subroutine at line 90 is used to slow the process down to a pace with which the eye and brain can

You should see that the interpreter uses up free string space at a rather rapid rate until it runs out of space. When this happens a garbage collection routine compacts all the currently active strings at the top of string space and then releases the remainder and returns to running the program. With a very large amount of string space, this garbage collection routine can sometimes take several minutes to executive and if the actual amount of free string space is small, then it will take place frequently, slowing down the speed at which the BASIC program is running.

The machine language subroutine is completely relocatable but does use one ROM call to retrieve the parameter passed by the USR function. This address (\$B3ED) may need to be changed in future revisions of the Colour BASIC ROMs. You can use this technique to look at the operation of other BASIC statements by changing the program lines 40-80 and you will probably need to look at different areas of memory to see where the action is taking place. The only limitation so far seems to be that when the interpreter uses the normal text page, it sets the display offset register in the SAM to show the normal text page. However, with a little trial and error, you can use this method to explore the workings of your Colour Computer and its BASIC interpreter.

PEAGH ROW

If you own a Peach and are a new subscriber or have renewed your subscription with or subsequent to the first issue of Volume 4, then you are entitled to the new free software offer. However, the SOFTPAK program library is not suitable for the Hitachi Peach - instead, we offer our Peach readers the choice of one of three commercial games, viz. Peach Invaders, Ghost Gobbler or Scrambler. We are now at the stage where we wish to prepare and distribute this software gift but have encountered two difficulties:

1. Our mailing list does not identify all of our Peach subscribers.

2. We have no record of which particular

game you wish to receive.

If you are a Peach owner already entitled to receive the new free software or who will become eligible by renewing your subscription at some stage during Volume 4, then please drop us a line as soon as possible with the following information:

(i) Your name and address

(ii) Your subscription expiry issue
(iii) Your selection of one of the following: A—Peach InvadersB—Ghost Gobbler -Scrambler

Please direct this information to: PEACH FREE SOFTWARE. MICRO-80, P.O. BOX 213, GOODWOOD, S.A. 5034

Many of our readers with disk systems will appreciate the GRAFX utility in this month's issue. A number of people have recently pointed out that many Level 2 BASIC programs utilizing machine language subroutines more often than not do not work with Disk BASIC (see Input/Output and below). The reasons for this are fairly obvious. Most Z80 machine code contains local absolute address references and cannot be easily relocated. Secondly, on 16K Level 2 machines, these subroutines are usually placed at the top of memory (i.e. below address 8000 Hex) which usually conflicts with the program storage area in Disk BASIC in the case of all but the smallest of BASIC programs. The program RECALL on the SOF disk offers one type of solution to this problem. Another approach is the following from one of our readers, Mr. Wilson of Toronto:

MODIFICATION OF 'GOLF' FOR DISK USAGE

I recently added a disk drive to my System 80 and then, of course, set about transferring all my tape based programs to disk. With most BASIC programs this

10 CLEAR 200, &H3F00

15 DIM B\$(26)

20 A=&H3F00 : DEFUSR0 = A

30 FOR I=0 TO 26 : READ A : POKE A+I,D : NEXT I

40 A=USR0(&H3E00) : A\$=""

50 FOR I=0 TO 26

60 A\$=A\$+CHR\$(I+63) : B\$(I)=CHR\$(32) : GOSUB 90

70 NEXT I

80 A=USR0(&H400) : END

90 FOR J=0 TO 750 : NEXT J : RETURN

100 DATA 77,38,23,189,179,237,70,198

110 DATA 7,142,255,198,70,36,6,48

120 DATA 1,167,128,32,2,167,129,90 130 DATA 38,242,57

presents no problem at all. However, any such program which contains a machine language subroutine will require some modifications. One program of this type which I have converted is GOLF which was published in the July 1983 issue of MICRO-80. The changes I made may be of interest to some other readers. This is particularly true because, although articles are often published which point out that changes are needed and some describe the disk instruction DEFUSR, I have not seen any which explain in any detail all the changes needed to convert a given program.

The DEFUSR function was described in the August 1983 issue of MICRO-80. However, a brief recap of its use is given here again for completeness.

In tape-based Level 2 BASIC the entry address of a machine language subroutine is divided into its least and most significant bytes which are POKEd into locations 16426 and 16527 before the routine is called using the A = USR(O) call. In disk BASIC the entry address is

defined by DEFUSRn = address where address is decimal or hexadecimal. The number n in the DEFUSRn statement can be 0 to 9 thus allowing up to 10 machine language subroutines to be defined. The calls to the subroutines are made by A = USRn(x). More details on DEFUSR and USR will be found in your DOS manual.

In the GOLF program there is a short machine language subroutine defined in statements 10 to 60. This routine actually stores the screen image of the GOLF hole so that it can be restored to the screen later in the program. The machine language statements are stored in the dummy string LL\$. The address of LL\$ is then POKEd in line 60.

routine The machine language works by storing the 1024 screen data values from addresses 15360 to 16383 into memory locations 30720 onwards. In a 16K machine the locations are above the addresses needed for the BASIC program so they are in a safe location. However, when disk BASIC such as DOSPLUS 3.4 is used, space up to about 21K is used by disk BASIC and GOLF then stores up to about 35K. Thus the machine language routine uses locations in which BASIC program statements are stored. This will cause chaos to say the least! The solution is to change the routine so that it uses much higher locations in memory.

The address which must be changed in the machine language routine is given by the sequence 0.120 which appears in line 10 and line 20 DATA statements. In line 10 it is items 14 and 15 and in line 20 it is items 7 and 8. 0,120 defines a hex location 7800 (or decimal 30720). My machine has 48K RAM and thus addresses up to 65535. I therefore decided to place both the machine language routine itself and the storage locations used by the routine above 63000. I used location FAOO (or decimal 64000) in the routine as a storage location. The value FAOO translates into data values 0,250. Thus, to effect the change, alter the value 120 in item 15 of line 10 and item 8 of line 20 to 250

The routine itself I decided to locate at 63500 (F80C in hex). This is achieved by replacing lines 30 to 60 of the original program by:

30 FOR I = 63500 TO 63529

35 READ LO

40 POKE I-65536,LO 45 NEXT I

DEFUSR = 63500

The final point to note is the POKE address in line 40. Because the System 80 can only handle integers up to 32767 it is necessary to use negative integers for the addresses above this value in POKE and PEEK statements.

With these two changes GOLF Now runs as it used to on tape.

WHAT YOU

Set out below is a list of some of the programs published in early issues of MICRO-80 magazine. Back issues are available for \$2.50 each or at the annual subscription rate for 12 or more copies. Cassette editions are available for all issues for \$4.00 each whilst DISKS are available for all issues FROM SEPTEMBER 1981 onwards. For 12 or more magazines with cassette/disks ordered at the same time, the relevant annual subscription rate applies. Programs for the Hitachi Peak/TRS-80 Colour Computer were first published in the April 1982 issue. Complete indices to the first three volumes of MICRO-80 magazine are included in the December 1980, December 1981 and the August 1983 edition.

NEWDOS 80 provides a copy of the original Radio Shack Editor/Assembler modified so that source files can be saved to or loaded from disk. However, on the Model 3, Apparat chose to drop support for cassette tape so that you cannot load source files from cassette at all. This can be quite frustrating if you wish to modify a source file you may only have on tape. The Source utility in this month's issue will overcome this problem and save you having to tape the source code in a second

BMON ON THE MODEL 3

A number of readers have enquired about using BMON on the Model 3, without much success. Interestingly, the Adelaide Micro User Group published in their October newsletter some patches developed by one Tony Domigan to make BMON work on the Model 3. His item is reproduced here with permission for the benefit of our readers

Eddy Paay's BMON will not work on the Model 3 because it uses the Model 1's keyboard caller address (03E3H), and jumps to BASIC via 06CCH. Rather than just patch the old caller with 3024H I have reworked some of Eddy's code to patch the current keyboard caller thus allowing BMON to work in Newdos, Ldos and TRSdos Disk BASICs as well as Model 3 BASIC. Furthermore, all cassette routines will prompt you for the baud rate to use and the ASCII character will now be displayed alongside the hex character in the edit mode.

Edit characters (below) enclosed in brackets, e.g. (FX) are for the 48K version only. If you are using a 32K BMON then substitute 'BX' and for the 16K version use '7X'.

1. (a) Reserve Memory (b) Load BMON thru SYSTEM . . . BMON (c) In place of answering '/ENTER'

substitute . . /64464 (48K), /48090 (32K), /31696 (16K)

Disk users should re-boot DOS and transfer the program using the 'DUMP' command.

-Adelaide Micro User News October, 1983.

DEFUSR PROBLEM

Some programs intended for Level 2 systems will cause problems when you try to run them on the Model For example, Andre Marino reports the following difficulty:

"I am writing about a program you have already published two months ago (August, 1983). The program is DEFUSR. I am having problems in getting the program to load. The program loads for a brief second and then the screen scrolls up with a continuous flow of question marks. I have a TRS-80

Model 3 48K cassette based computer. My belief, through some experimentation, is that the program is in a bad area of memory, but have found no way to make the program work. I would appreciate it if you could help me out with this problem.'

The memory from 4040H to 404FH is not a good place to put machine language programs on the Model 3. Although the Level 2 scratch pad areas used by the Model 1 and Model 3 are the same, most of the reserved RAM area used by the Disk Operating System is quite different. Parts of the Model 1 DOS reserved RAM is used to implement other features in the basic Level 2 mode of the Model 3 and more low memory is reserved for use by the DOS. This means that those machine language programs residing in Model 1 DOS reserved RAM locations will probably not work on a Level 2 Model 3. There are two solutions to this problem. The first involves protecting some high memory and moving the program to high memory (suggested in the Form

Three column of the same issue). The second is to 'hide' the program between the reserved RAM and the start of the BASIC program storage area by moving the latter to a higher memory

If the particular machine language program is not relocatable and contains local absolute address references, then these must all be changed to reflect the program's new location in memory. If the source code is available then this is best done by reassembling the program at the new memory location by changing the ORG statement. If only the object machine code is available, then this can be a long and complex task which must be done by hand. Fortunately, the DEFUSR program does not require any such changes as it is relocatable. The first method has the additional disadvantage that you must protect high memory each time before using the program.

The second method is more

elegant in the case of relocatable machine language programs and can be achieved by the following code:

4F00 4F00 2AA440 4F03 225C41 4F06 11194F 4F09 1A 4F0A 77 4F0B 13 4F0C 23 4F0D B7 4F0E 20F9 4F10 22A440 4F13 CD4D1B 4F16 C3191A 4F19 CF 4F1A C1 4F1B CF 4F1C D5 4F1D CD3723 4F20 E5 4F21 CD7F0A 4F24 228E40 4F27 E1 4F28 C9 4F00	00100 ; DEFUSR for the control of th	4F00H HL, (40A4H) (415CH), HL DE, DEFPRC A, (DE) (HL), A DE HL A NZ, LOOP (40A4H), HL 184DH 1A19H 8 B 0C1H 8 B 0D5H L 2337H HL L 0A7FH (408EH), HL	; Entry /20224 ; Start of BASIC pointer ; Disk BASIC exit for DEFUSR ; The DEFUSR code address ; Move the code to where ; BASIC programs normally ; start ; Loop until finished ; Set new Start of BASIC ; Do a 'NEW' to setup the ; remaining BASIC pointers ; Return to BASIC ; DEFUSR code ; Mandatory terminator
--	--	---	--

This program will tuck DEFUSR between reserved RAM and the BASIC program storage area. This technique could also be used to place other programs here with some precautions. The program should be relocatable and must 10 'DEFUSR for the Model 3 not contain a zero within its code (since the particular loop that moves the program code terminates when a zero is encountered -- a different loop structure could be used). If you don't have an assembler then the following BASIC program will load the program into memory and run it:

Be warned, this will destroy any resident BASIC Program so CSAVE the program before you RUN it.

PROGRAMMIN

AN EXPLANATION OF HOW TO MAKE FULL USE OF THE PEEK, POKE AND USR STATEMENTS

by Gordon S. Thomas

The object of this article is to explain the use of the PEEK, POKE and USR statements and functions in Level 2/Model 3 BASIC following a request in the "Readers' Requests" section in the "Readers' Requests" section in Micro-80 Vol. 3 No. 10 (September 1982). The article assumes no previous knowledge of the uses of these statements.

Unless otherwise stated, all information contained herewith is equally applicable to TRS-80 Models 1 and 3 cassette and disk systems (and all other software compatible computers) with any memory size. It is not applicable to Level 1 BASIC computers since they do not have these statements.

The computer's memory is made up of two main types of memory, which are Read Only Memory (ROM) and Random Access Memory (RAM). ROM is where the Level 2/Model 3 BASIC interpreter is stored. ROM cannot be changed by any software (i.e. written to).

RAM, on the other hand, can be changed and it is here that all user programs and data are stored (until the power is disconnected). Therefore, to modify the computer's operation in any manner by software requires that the contents of RAM be changed.

The Z80 microprocessor contained in the computer is capable of interacting with 65536 memory locations. Depending on the computer, anywhere between 12K and 14K of these memory locations are used by the ROM with the rest being used by the RAM. Each one of these memory locations is assigned a number, called an "address". It is these addresses which the PEEK function and the POKE statement require in their

respective syntax.

There are various, different ways of referring to these addresses. They can be numbered using the decimal system (which is just our normal everyday counting system) or they can be numbered using the hexadecimal system, which is what the computer uses. (This is not strictly correct but is adequate for the purposes of this article).

The hexadecimal system uses the digits 0-9 and the letters A-F to designate the decimal numbers 0-15 respectively. Instead of each place in a number being a power of 10 (as it is in the decimal system) the hexadecimal system has every place representing a quantity of a power of 16. e.g. 38 (decimal) = $(3 \times 10^{1}) + (8 \times 10^{0})$

 $30 \text{ (hex)} = (3 \times 16^1) + (8 \times 16^0)$ 56 (dec) $38 \text{ (dec)} = (2 \times 16^{1}) + (6 \times 16^{0})$ 26 (hex)

PEEK: If we want to know what value is stored in a particular address all we have to do is type: PRINT PEEK (address) e.g. to find out what is stored in the top left hand corner of the screen (address 15360) we would type PRINT PEEK (15360)

This will return a decimal number which represents what is contained in address 15360. Therefore if the top left hand corner of the screen contains the letter "B" then the decimal value 66, which is the ASCII code for the letter "B", will be returned.

Any "ddress in the computer's memory can be PEEKed (i.e. from 0 to top of RAM). The top of RAM addresses for the various memory sizes are as follows: Mem Size Hex

Dec 32767 7FFF 16K 32K BFFF 49151 48K FFFF 65535

In order to PEEK any address above 32767 it is necessary to subtract 65536 from the address in question. e.g. to display the contents of 40000, type

PRINT PEEK (-25536) since 40000 - 65536 = - 25536. The hexadecimal equivalent of 40000 is 9C40H since 9C40H = (9×16^3) + (12×16^2) + (4×16^1) + (0×16^0) = 40C00 where H indicates that it is hexadecimal quantity.

However, if you type (for Disk

BASIC only)
PRINT &H9C40 (syntax for 9C40 hex) the computer will respond with - 25536, i.e. the computer takes care of the conversion process. This is why many programmers prefer to use hexadecimal when referring to memory addresses - it requires no additional calculations to determine what number to use to designate a particular address. In general, to PEEK any address

in the computer's memory, type
PRINT PEEK (X + 65536 * (X > 32767)
For X > 32767 the expression
(X > 32767) will be TRUE, resulting in -1.

This effectively subtracts 65536 from the address.

For X < = 32767 the expression (X > 32767) will be FALSE, resulting in 0. This will not affect the address in

any way.

The same rules apply for the addresses in the POKE statement. POKE: If we want to change the contents of a particular memory location we use the POKE statement. Its syntax is

POKE address, value e.g. to store a "1" in the top left hand corner of the screen we would type

POKE 15360, 49 (49 is the ASCII code for the number "1")

The POKE statement is useful for loading small machine language routines into memory to be accessed from BASIC. It also has many other uses. Some of the most common are:

1. setting memory size from BASIC (addresses 16561 - 16562)

2. loading graphics character onto the screen (addresses 15360 -16383)

3. disabling the (BREAK) key in Cassette BASIC

(addresses 16396 - 16397) 4. pointing to a USR routine in Cassette

(addresses 16526 - 16527)

In order to be able to fully utilize the capabilities of the POKE statement it is necessary to have a basic under-standing of the terms "least significant byte" and "most significant byte". When we see the number 327 in everyday life we all know what it represents, since we are used to dealing with decimal quantities. The 3 can be thought of as the most significant digit and the 7 can be thought of as the least significant digit. In hexadecimal we group two digits together and call it a byte.

(40000 decimal) e.g. for 9C40H the most significant byte is 9CH with the least significant byte being 40H. The decimal equivalents of 9CH and 40H are 156 and 64 respectively. There is an alternative way of determining these numbers. Note that 156 is actually stating how many whole lots of 256 (decimal) that there are in 40000, and that 64 is stating how many

lots of 1 there are left over. i.e. $40000 = (156 \times 256) + (64 \times 1)$ Therefore we can arrive at the numbers using the following

procedure.

MSB = INT (40000/256) = 156

LSB = 40000 - (256 x MSB) = 64 Either of these methods may be used to determine the LSB and MSB of any address for which they are required.

Many settings require this exact format to be used in order to change them. For example, the memory size is stored in addresses 16561 - 16562 in the format LSB.MSB.

i.e. 16561 contains the LSB, and 16562 contains the MSB

This is true in general for all two byte quantity storers. The first address contains the LSB and the second address contains the MSB. Therefore to set a memory size of 40000 we would have to

type POKE 16561,64 POKE 16562,156 CLEAR XXXX

where xxxx is the string space required.
The CLEAR forces BASIC to recognize the new top of memory. This technique for setting the memory size can be used on both cassette and disk systems and saves the operator from having to enter the memory size at power-up in response to the "Memory Size?" question. The program included with this article provides an example of the use of this facility.

POKE is also used on the model 3 to set values for a whole range of different features, e.g. to prevent the top two lines of the screen from scrolling, type POKE 16916.2

or, to set the special characters mode,

POKE 16420,1

(This saves using PRINT CHR\$(22) which can be a nuisance since it is effectively only a toggle switch and the programmer can never be certain which mode is set).

For other useful addresses on the Model 3, refer to the Model 3 BASIC Reference Manual, pp. 83-84.

USR: The USR function is used to provide an interface between a BASIC program and a machine language subroutine to be called from the BASIC program. Once a machine language subroutine has been poked into memory (see later) BASIC needs a way to call it. The USR function caters for this requirement.

Before BASIC can call a machine language subroutine, it needs to know where the entry point is located in memory, i.e. where to start executing from. In Cassette BASIC this is achieved by POKEing the address in LSB, MSB format into memory locations 16526-16527. For Disk BASIC it is achieved by typing DEFUSRx = address

where x is a number from 0 to 9 indicating which USR routine is being used (since Disk BASIC provides the choice of 10 possible USR routines).

e.g. If the entry point is 40000, For Cassette BASIC, type POKE 16526,64 (LSB) POKE 16527,156 (MSB) For Disk BASIC, type DEFUSRO = 40000 DEFUSRO = &H9C40 to use USR

routine 0

The machine language subroutine can then be accessed by typing

X = USR (arg) for Cassette BASIC and X = USRO (arg) for Disk BASIC (Note: The Disk BASIC call will function correctly without the 0 but it is always safest to include it so you don't forget which routine you're accessing).

The number enclosed by the parentheses, (arg), is an integer argument which can be sent to the machine language routine. For example, if we had a routine to scroll a certain number of lines up the screen, the argument would be the number of lines that we wanted to scroll. The argument sent to the routine may be any integer in the range -32768 to +32767 inclusive. If the programmer does not wish to send an argument then the number enclosed by the parentheses is considered to be a dummy argument and is only there to satisfy the syntax requirements of the USR function

The variable assigned to the USR routine (in this case X) will contain the argument sent from the machine language routine, if any.

LOADING MACHINE LANGUAGE SUBROUTINES INTO MEMORY: There are several ways of loading machine language subroutines into memory. The easiest and the most obvious way is to load it via the SYSTEM mode in a cassette system or via the DOS command LOAD In a disk system. However, these two methods are only any good if you have an assembled version of the subroutine stored on disk or tape, whatever the case may be.

For other methods of loacing machine language subroutines into memory, I thoroughly recommend a copy of Lewis Rosenfelder's book "BASIC

Faster and Better & Other Mysteries', which is available from MICRO-80 for \$39.95 and is also listed in Tandy's RSC-9 Catalogue for \$39.95.

The method that I will use is the one which I consider to be the easiest to understand and modify for the various memory sizes. This method involves POKEing the values into memory byte by byte from DATA statements.

I have included two sample programs with this article. The first of these programs provides a substitute for the BASIC INPUT statement. It is superior to the statement it replaces in the following respects:

- The BREAK, CLEAR and all arrow keys except the back arrow are all locked out.
- 2. The ENTER key will be ignored if the current length of the input is zero.
- 3. It provides a flashing cursor (for both Models 1 and 3).
- 4. The cursor may be changed to any character available in the computer's character set with a simple POKE statement.
- 5. It will only accept a predetermined length of input (specified by the pro-

grammer in the USR call) and then the cursor is changed to a non-flashing program-definable character indicating that no more input will be accepted.

- that no more input will be accepted.

 6. Because it is written in machine language, it cannot be out-typed as can so many of the equivalent BASIC routines.
- 7. It shows the operator how many characters may be entered by displaying a number of characters on the screen corresponding to the maximum length of the input.
- 8. It will accept all delimiters (e.g. commas) without ignoring the characters which are entered after them.

In summary this routine effectively gives BASIC a super-powered LINE-INPUT function. It can be used on both cassette and disk systems, as can the BASIC program which enters the routine and demonstrates how to use it in your program.

Program Listing 1 is the documented source code for the USR routine to replace the INPUT statement. This routine only makes use of four ROM routines all of which are located in the same place on Models 1 and 3. These are

the 49H ROM routine which waits for a character to be entered from the keyboard, and the 2BH ROM routine which accepts a character from the keyboard if a key has been pressed. Both of these ROM routines are documented in the technical information section of the Model III Reference Manual. I checked with the Memory Map for Level II in '80 Micro — a Wayne Green Publication (Dec. 82 pp. 298-311) and found these same ROM routines for the Model I. The other ROM routines referred to are the ones for accepting and sending arguments from and to BASIC. These routines (0A7FH and 0A9AH) are documented under the USR function in both the Level II and Model 3 BASIC Reference Manuals. They are the same for both computers. Therefore I foresee no problems with getting this routine to work on either computer.

The source listing as shown has been assembled for a 48K computer with an origin of FFOOH. However, this should be changed to BFOOH for a 32K computer and 7FOOH for a 16K computer. The source code may then be entered into a computer via an editor/assembler such as EDTASM.

For those who do not have an editor/assembler, Program Listing 2 is the BASIC program which will enter the routine into memory. This program will work on either a disk system or a cassette system with any memory size. The numbers contained in the DATA statements are the decimal equivalents of the hexadecimal numbers in the second column on the left of the source listing.

The program operates in the following manner:

It obtains the current tup of memory from the addresses 16561-16562 and allocates room for itself just below the top of memory. This is done in 256 byte increments so as to make relocating the routine easy. Unfortunately, I could not make the routine truly relocatable (I had to include two JP instructions which are not relocatable) and therefore I had to have the BASIC program which POKEd the routine into memory do the relocating for me. It then resets the top of memory to protect itself and prevent BASIC from storing data up there and writing over the routine. It then proceeds to POKE the data into memory and once this has been completed, the routine is ready for use. The program then sets up the USR routine pointers using the addresses 16526-16527 or the DEFUSR statement, whichever is applicable.

To access the routine from BASIC, insert a line of the following form in your program: 1000 I^{\$} = " "

'Clear the variable to contain the input :X = USR(L) :POKE VARPTR(I\$),X 'Make the call 'Set the length of I\$

:POKE VARPTR(I\$) + 1,2'LSB of address to 1\$

'MSB of :POKE VARPTR(I\$) + 2,NT address

The argument L is the maximum length of input to be enforced by the routine. It may be a variable, a constant or an expression. Therefore if L=15 then the routine will only accept 15 legal characters of input from the keyboard. On return from the routine the actual number of characters entered by the operator is stored in the variable X.

This demonstrates a very powerful use of the POKE statement in conjunction with the VARPTR (or variable pointer) function. If you have a string variable, for example A\$, and you type PRINT VARPTR(A\$)

the address where the length of the string contained in A\$ is stored in memory will be returned. Therefore it follows that if you

type PRINT PEEK(VARPTR(A\$)) then the length of the string contained in A\$ will be returned. Similarly, PRINT PEEK(VARPTR(A\$) + 1) will return the LSB of the starting address of the contents of A\$ in memory and PRINT PEEK(VARPTR(A\$)+2) will return the MSB of the same address. Proceeding further on this idea, if you let F = PEEK(VARPTR(A\$) + 1 + PEEK(VARPTR(A\$) + 2) * 256

and then type

PRINT PEÉK(F)

then the ASCII value of the first character in A\$ will be displayed.

The program uses this idea in the last three POKE statements. Since I\$ is the variable set up to contain the input and X is the actual number of characters entered by the operator, it seems reasonable that the length of I\$ should be X. This is the purpose of the first POKE statement. It merely POKEs X in the memory location where the length of I\$ is stored. The purpose of the next two POKEs is to point I\$ to the input entered by the operator which is located in a known buffer set up in the machine language routine. The BASIC program to enter the routine is set up in such a way as to always have the LSB of the address. containing the input as 2. The MSB of the address is the MSB of the memory size 1 (since the input is stored in the address which is 2 bytes above the maximum memory address accessible by BASIC i.e. the memory size). The variable NT contains the MSB of the memory size and it is this value which is POKEd into the MSB location. On completion of these three POKEs, the variable I\$ will contain the input entered by the operator and may be processed in the same manner as any standard string variable (because that's all it is). To process numeric data, the VAL function of BASIC can be used. e.g. if \$1 = "23" then PRINT VAL(I\$) will

return the number 23 as distinct from the string "23".

string

The routine should be POKEd into memory very early on in your program since it adjusts the memory size and clears all variables on initialization. It only uses about 250 bytes of top memory and once it has been entered into memory the data lines can be deleted if memory is precious.

In order to be able to make use of the many features of the routine, it is advantageous to set up a variable just after the initialization sequence as follows:

MS = NT * 256

Once this has been done POKEing different numbers into the following addresses allows you to change the settings

of the routine:		
SETTING	ADDRESS	DEFAULT
Character to be displayed in-		
dicating length of input	MS+79,	
	MS+203	136
Cursor character (when "on")	MS+96	143
Cursor character (when "off")	MS+ 117	32
Character to be displayed in-		
dicating end of input	MS+136	60
Cursor flashing speed—'on''		
delay	MS+94	90
'off'' delay	MS+ 115	90

All settings listed here require integer values in the range 0-255. In the case of characters to be displayed, ensure that the number you choose has a character corresponding to it which is displayable by your computer. Where two addresses are listed, this means that both addresses must be changed for the feature to function properly.

There are two states in which the cursor can be. It can either be "on" (like it is for the length of time that you can see it while it is flashing) or it can be "off". If these states change at regular time intervals (e.g. every half a second) the effect of a flashing cursor is created. This is what is meant by the cursor is created. This is what is meant by the cursor being "on" and "off". We usually associate a flashing cursor with a CHR\$(143) graphics block blinking on and off. In this case, the "on" character is CHR\$(143), the graphics block, and the "off" character is a CHR\$(32), a blank. This routine allows you to define what the cursor's "on" and "off" characters are and by POKEing values into the specified addresses you can change

these characters to what every you like.
By POKEing different values into the addresses specified above for the "on" and "off" delay, you can increase or decrease the flashing speed of the cursor according to your requirements. To see which values are currently set, all you have to do is PEEK the addresses corresponding to the feature about which your require information and this will tell you the value of the setting. Always remember that just because you have a machine language routine stored up there in protected memory, that doesn't mean that you cannot modify its operation to suit your own ends by using the POKE statement.

In conclusion, I hope that this article has fulfilled the needs of those people who requested it, and since this is my first article, I would appreciate any feedback on it (whether positive or negative) so that I will know whether I have covered the requested material adequately. 58 Warnbro Beach Road, SAFETY BAY, W.A. 6169

I will be happy to try and answer any queries that readers may have. Please include a self-addressed stamped envelope.

ADVENTURE SYSTEM

A SOFTWARE REVIEW

by Ed Grigonis

Those of you who have ever considered writing an Adventure would know that there are a number of ways of achieving this objective. These various methods may be summarised as follows:

(a) Dig into an existing Adventure and change the existing data. The major flaw with this method is that you are restricted to the original Adventure format.

(b) Write a BASIC Adventure. This is OK but you will find that memory limitations (particularly in a 16K computer) will prove frustratingly restrictive. The process of actually coding the Adventure will also detract from the task in hand.

(c) Use the Adventure Generator included in "The Captain 80 Book of Basic Adventures" to get rid of the drudgery. This is OK as well, but you may still be hampered by memory limitations.

(d) Learn machine language. If you want the latest fantastic graphics Adventure then this is the way to go. Be prepared to devote a lot of time to the

If, on the other hand, your only objective is to write a great Adventure and you aren't particularly interested in graphics then you can always take the easy way out. This will still involve learning a new computer language but the effort required is minimal when stacked up against the alternatives.

What I am talking about is the Adventure Language as contained in "The Adventure System" from the Alternative Source.

First, a bit of history. Hands up all those who think Scott Adams actually sat down and wrote a completely new machine language program for each of his Adventures? Sorry, folks! 'Taint so!!! What he actually did do, very early on, was to sit down and write himself an Adventure Editor in machine language. Most of his Adventures were actually written by feeding data into this program and letting it do all the hack work. I suspect that similar methods were used to get his Adventures onto other computers.

Unfortunately, the Adventure Editor used by Scott Adams has never been available via the commercial market. Into the picture stepped Allan Moluf, known author of programs for the TRS-80, and Bruce Hansen, author of "Tasmon" Allan Moluf produced a BASIC Adventure Editor as well as a companion BASIC Driver program to use the generated data base. Subsequent machine language

enhancements were added by Bruce Hansen. This first effort evolved into what became known as "The Adventure

Current versions of "The Adventure System" have been fully implemented in machine language by Bruce Hansen and are, so far, fully compatible with the Scott Adams effort. "The Adventure System" is available to anyone who cares to send The Alternative Source enough money to buy it.

I mentioned that this system requires you to learn a new language. What follows is a discussion of the language and how it is used to create an Adventure which looks just like a Scott Adams

original.
"The Adventure System" requires you to specify the following details when entering your data:

- (a) Objects. (b) Messages.
- (c) Rooms
- (d) Vocabulary.
- (e) Actions.
- (f) Header information.

OBJECTS

Each object specified in the data must contain three parameters: object number, starting location and object description.

The object number is specified by the Adventure Editor when you first enter the information. The first object will always be numbered 0 (zero) and the last object will always be numbered one less than the total number of objects.

The starting location is the number of the room in which the object will be placed at the beginning of the Adventure, i.e. if you specify 3 then the object would initially be located in Room 3.

The object description tells you what the object actually is, whether it can be manipulated and whether or not it is a treasure.

Consider the following three objects:

0: 3 Pile of rocks

1: 5 Large rock/ROCK/ 2: 4 *SPARKLING DIAMOND*/DIAM/

Object number zero will be found when the adventurer goes into Room 3 with the above description displayed by the Adventure Driver. The object cannot be manipulated.

Object number one will be found in Room 5. The provision of the short description between slashes tells the Adventure Driver that this object may be manipulated, i.e. picked up, thrown, whatever

Object number two will be found in Room 4. This object can be manipulated. The leading asterisk in the object description tells the Adventure Driver that this object is a Treasure. Object two would be taken into account for scoring purposes if you placed it in the Treasure Room.

As you can see, there is nothing difficult about specifying objects.

Object number 13 is reserved for

the artificial light source, viz. lamp, matches, etc.

MESSAGES

Specifying messages is even simpler than objects. The Adventure Editor will specify suitable numbers when you first enter the messages. Message O is reserved so your messages will always start at number one.

A sample message would appear as follows:

1: There is a fly in my soup.

This message would be printed

whenever the driver was required to print message number one.

ROOMS

The parameters required when entering Room details into the Editor are Room Number (given by the Editor), allowable directions and Room description.

When entering Room details the Editor will ask for six Room numbers corresponding with Rooms which may be entered from the current Room. These numbers will also correspond with the directions North, South, East, West, Up and Down.

The Room description determines what the Driver will print when you are in a particular Room.

Consider the following two Room descriptions:

1: 0 5 23 0 0 0 large crate
2: 0 0 0 12 6 0 *1'm outside the shop
Room number one leads into
Rooms 5 and 23 by going South and East respectively. The Driver would show South and East as obvious when you are in Room 1. The actual Room description would be preceded by the phrase "You're

Room number two leads into Rooms 12 and 6 by going West and Up respectively. The leading asterisk in the description prevents the default phrase being printed.

It is important to note that the allowable directions can be overridden by allowing the adventurer to move to another room by specifying a suitable command, i.e. GO SHED.

If the adventurer moves in an illegal direction when a light source is available, he will receive the message "I can't go in that direction". If he moves in an illegal direction in the dark, he will be killed.

The last Room is reserved for a

'Limbo'' state when the person has been killed, and may or may not have exits into other rooms.

VOCABULARY

The vocabulary details all verbs and nouns which may be used in the Adventure.

Predefined Verbs are as follows: **AUTO**

- GO
- 10 GET
- 18 DROP
- Predefined Nouns are:
- 0 ANY
- NORTH
- 2 SOUTH
- EAST
- WEST UP 456

DOWN

Primary vocabulary words may, have as many synonyms as required but these must follow the relevant primary word and must each be preceded by an asterisk, i.e.

- DOG *HOUND
- 8 *BASSET

ACTIONS

Actions are the heart of an Adventure and are where newcomers to "The Adventure System" will have the most difficulty.

Action entries contain the following information:

Verb, Noun, Conditions, Commands and

Action Titles simply document the function of a particular entry. They act as comments and may be omitted, although as with any programming language, it is

a good idea to liberally comment source

The verb and noun entered by the adventurer are used to determine which conditions and commands will be acted on. For example, if the adventurer were to enter "CLIMB TREE", the Driver would only consider those Action entries with the verb, noun combination of "CLIMB TREE". Of course, if "CYPRESS" had been defined as a synonym of "TREE", then "CLIMB CYPRESS" would also be

then "CLIMB CYPRESS" would also be acceptable in the example given.

The "conditions" of an Action entry provide a list of test which must be passed in order for the "commands" of the Action entry to be carried out. The "commands" of the Action entry are only carried out if all the "conditions" are met.

Before describing a few Action entries I will discuss the available "conditions".

tries I will discuss the available "conditions" and "commands".

CONDITIONS

This condition always passes and is used to pass a parameter onto a commend. The analogy with BASIC is the 'DATA' statement. This conditions passes if the

HAS adventurer is carrying the object referred to, i.e. HAS 15.

INW passes if the adventurer is in the same Room as the numbered object, i.e. IN/W 15. passes if the adventurer is in the

AVL same Room as the object or is carrying the object.

passes if the adventurer is in the numbered Room, i.e. IN 5.

-INMpasses if the numbered object is either held by the player or is in another ROOM, i.e. —IN/W 15 passes if the player is not carry--HAVE

ing the numbered object. -INpasses if the player is not in the

numbered Room. BIT passes if the numbered bit flag

is set. -BIT passes if the numbered bit flag

is cleared. ANY passes if any objects are being carried.

-ANY passes if no objects are being

carried. -AVL passes if the numbered object is

in any other Room. -RMO passes if the numbered object is

not in Room zero. **RMO** passes if the numbered object is in Room zero.

CT < = passes if the counter is less than or equal to the number specified. **ORIG** passes if the numbered object is

in the same room it started in. -ORIG passes if the numbered object is not in the same Room it started

in. passes if the counter is equal to the number specified.

(Any numbers input with a condition must be in the range 0-1600)

COMMANDS

This is a "null" command. 1-99

Display messages 1-99.
If this followed a PAR 5, then ob-GETX ject number 5 would be picked

DROPX If this followed a PAR 5, then object number 5 would be dropped. If PAR 22 was specified, the GOTOY player would be moved to Room

X-RMO PAR 5 would cause object 5 to be moved to Room zero.

NIGHT Sets the light/darkness bit flag (15). If the artificial light source is unavailable the Room will be dark and no Room description will be given.

Clears the light/darkness flag. PAR 4 would cause bit flag number 4 to be set. SETZ

 $X \rightarrow RMO$

PAR 5 would cause object 5 to be moved to Room zero. CLRZ

PAR 4 would cause bit flag number 4 to be cleared. DEAD Clears the light/darkness flag, moves the player to the last Room and tells him he is dead.

PAR 5 PAR 22 would cause ob-X -> Yject number 5 to be moved to Room number 22.

FINI Indicate that the game is over and enquire about a replay.

DSPRM Display current room if it is light or the artificial light source is pre-sent, else display "It's too dark to see".

SCORE Display number of treasures in the Treasure Room and the percentage of treasures stored.

List inventory.

Set bit flag zero. Clear big flag zero. SETO CLRO

FILL Refill the artificial light source. Has no effect but was included to maintain compatibility with the original BASIC system. CLS

SAVE Save the game to disk or tape

depending on the version. PAR 5 PAR 15 wor'd cause the EXX.X location of object number 5 to be swapped with the location of the object number 15.

Allows continuation of an Action

entry.

AGETX PAR 5 would enable object number 5 to be obtained even if the carry limit has been exceeded.

BYX -> XPAR 5 PAR 15 would cause object number 5 to be placed in the same Room as object number

CT-1 Subtract one from the counter value

DSPCT Display current value of the countér.

CT<-

PAR 100 would set the counter to a value of 100.

EXRMO Exchange the current Room number with the Room number held in Alternate Room Register zero.

EXM,CT PAR 5 would cause the value of the current counter to be exchanged with counter number 5. CT+ PAR 60 would add 60 to the cur-

rent counter. PAR 10 would subtract 10 from CT-N the current counter.

SAYW Display the noun (second word) input by the player. Start a new line on the display.

SAYCR EXC,CR PAR 2 would cause the current Room number to be swapped for the Room number currently held in Alternate Room Register number 2.

DELAY Pause for about 1 second before going on to next command.

EXAMPLES

To discuss all of the possibilities inherent in the above would take a year's issues of this magazine so I will just give a few examples from the Manual.

0: AUTO 100 - BIT 1 PAR 1 0 0 0 MSG 1 SETZ - INTRO INTRO MSG 1 The 0: shows that this is Action 0.

AUTO 100 causes this action to be considered all of the time. When the Adventure is started, all bit flags are clear. In this case - BIT 1 would therefore be true. PAR 1 passes the parameter 1 to the

commands. The O's indicate that there are no more conditions to be met. MSG 1 causes Message Number 1 to be printed. SETZ obtains the parameter of 1 from the PAR 1 condition and therefore sets bit flag number 1. Unless bit flag number 1 is cleared at a later stage by a different command, this is the last time this command will be executed. The dashes indicate that there are no more commands in the Action entry. INTRO is simply a comment. 11: GET KEY INW 12 PAR 12 11: GET KEY 0 0 0 GET MSG 5

If the player were to enter "GET KEY" this Action entry would be considered. If the player is in the same Room as the key (IN/W 12) the parameter of 12 (presumably the object number of the key) would be passed to the GETX command which would cause the player to pick up the key. Message 5 would then be printed. Note that if the player was already carry ing the key he would automatically get the message 'I'm already carrying it'.

14: GO DOOR IN 2 PAR 3 0 0 0 GOTOY MSG 5 — —

If the player was to enter "GO DOOR" then, provided he was currently in Room 2, the parameter of 3 would be passed to the GOTOY command and the player would be moved to Room number

3. Message number 5 would be printed. These are only three examples. However, by studying these examples and also the conditions and commands summarised earlier, you will see that the scope provided within "The Adventure System" is indeed comprehensive.

HEADERS

The best way to explain the header is to give an example from the manual.

Adventure Z Version 1.01 14500 bytes free

Bytes under 16K = 7523 #OBJ #VOC #RM #ACT 41 22 8 14 BEG #TR WLEN MAX TIME #MSG TR-RM 16

999 The name of the Adventure is "Adventure Z" and the version number is 1.01. There are currently 14,500 bytes free, although for any particular Adventure this would bepend on your computer's configuration and the presence of any high memory drivers. There would be 7523 bytes free if this Adventure was entered as a SYSTEM tape in a 16K computer. There are 14 objects and 41 actions. There are 22 verbs and 22 nouns (although one might be less). There are 8 Rooms. The adventurer can carry a maximum of 5 objects. The adventurer will begin in Room number 1. There is only one treasure. The number of significant letters in nouns and verbs is four. The time limit is 999 moves. There are 16 messages. The treasure room is Room number 7

All of this information is entered when you commence compiling the Adventure.

ADVEDT LIMITATIONS

The following limitations (if you can call them that) are imposed on the data entered into the ADVEDT program:

- (1) Maximum of 500 Action entries.
- (2) Maximum of 150 vocabulary entries (150 verbs and 150 nouns).
 (3) Maximum of 100 rooms.
 (4) Maximum of 99 messages.
 (5) Maximum of 250 objects.

- (6) Maximum characters in description of object, room or message is 255.
- (7) Maximum word length of vocabulary words is 7 characters.

(8) Maximum length of Action titles is 20 characters.

To give you a comparison, the following are the maximums from the Scott Adams Adventures: 270 Action entries.

80 Vocabulary words. 100 Objects.

WHEREDAYAGEDDIT???

As far as I am aware, "The Adventure System" is only available from The Alternate Source, 704 N. Pennsylvania, LANSING, MI. 48906 U.S.A. The cost of the program is \$US49.95 plus postage. If you write to them to ask about the cost of airmail, make sure you enclose some international reply coupons.

WADDAYAGET???

Before I tell you what you get, I should point out that you will need to have 48K of RAM available. There are versions, however, for both disk and tape.

If you order the tape version you will get two programs. ADVEDT — the actual Adventure Editor and ADVTT which will enable you to create a SYSTEM tape from any Adventure data base you create. The disk version also includes ADV which is a disk based Adventure driver. ADVEDT in both versions contains ADV so when you are writing Adventures you can jump back and forth between the Editor and Driver.

Each version also includes a short Adventure which is fully explained in the documentation as well as two full length Adventures.

The documentation is supplied in a sturdy black vinyl binder. The original manual was somewhat hard to follow in parts. However, there is now a much more detailed manual which just about ranks alongside Bruce Hansen's excellent "TASMON" documentation for ease of use and clarity.

WHAT? IS THERE MORE?

Also included is Issue No. 1 of the Auggies newsletter "Augment". If you buy "The Adventure System" you are entitled to join the Auggies (Adventure User Group). For \$US12.00 per year (extra for airmail) you receive the "Augment" quarterly which includes at least one Adventure. You are eligible to market your Adventures through The Alternate Source, provided they are suitable, and thereby derive royalties. You can also purchase any Adventures created with "The Adventure System" at a discount.

The Alternate Source also have the following Adventure utilities available for purchase. ADVTAPE is similar to ADVTT and will create a SYSTEM tape from a disk data base. This avoids having to save the data base to tape first. ADVCOPY will take the Adventure off a protected Scott Adams Adventure disk and place it on an unprotected disk. ADVDUMP will read in a tape Adventure and dump the data base to disk. You have to be an Auggie to get these utilities.

I could quite easily go for a lot longer. There is so much that I haven't even touched on.

To summarise, if you like playing Adventures or if you are at all interested in writing Adventures, then you should definitely buy "The Adventure System". You won't regret it!

A REVIEW OF THE TRS-80 MG-10

(COLOUR COMPUTER)

by Charlie Bartlett

It never ceases to amaze me how computers are getting smaller all the time. When the Model 1 TRS-80 came out, it was thought to be incredible that a computer was actually crammed underneath the keyboard. Now we have the TRS-80 MC-10 upon us and it makes the Model 1 TRS-80 look like an Elephant or maybe a Dinosaur would be more appropriate consindering that the Model 1 is out of production.

The MC-10 is 2 inches high, 81/2 inches long and 7 inches wide, (51mm x 216mm x 178mm), and weighs in at 291/2 ozs (836.32 grams). The Microprocessor is an 6803 and is not fussy about spaces around keywords as is the 6809E in the Colour Computer, which is just as well considering the 3142 bytes of memory available in the MC-10. I was quite surprised at the number of commands that such a small machine supports, in fact it has NEARLY as many commands as the unextended Basic in the Colour Computer. After some digging around in the memory I also found some commands that it supports that are NOT in the manual, more on this in a minute. Listed below are commands that are available, (as listed in the manual).

Computes absolute value. Returns ASCII code of first

ABS

ASC

character of string. CHR\$ Returns character for ASCII or graphics code. CLEAR Reserves bytes of string

storage. Loads Basic program from CLOAD cassette.

CLOAD* Loads numberic data into an array from cassette.

CLS(x) Clears display to specified col-

Continues program execution if CONT BREAK has been pressed. cos Returns cosine.

Saves a Basic program to tape. **CSAVE** CSAVE* Save contents of a numeric ar-

ray to cassette. Stores data in your program. DATA DIM Dimensions an array.

FND Ends program. EXP Returns natural exponential

Exponentiation character. FOR : Creates a loop

NEXT in a program. STEP with step to increment. **GOSUB** Sends computer to subroutine. Sends computer to a line. **GOTO**

IF/THEN Test a relationship. INKEY\$ Strobes the keyboard and returns the key being pressed.

INPUT Computer waits for input from the keyboard. INT Converts a number to an

integer.

Returns left portion of string. LEFT\$ LEN Returns the number of characters in a string. Assigns value to variable LET (optional). Lists program lines on screen LIST Lists program lines to printer. LLIST Returns natural logarithm. LOG LPRINT Prints an item on the printer. MEM Returns the amount of free

Returns a substring of another MID\$

Erases memory contents. NEW

ON × GOSUB

Multi-way branch to specified subroutines.

ON × GOTO

Multi-way branch to specified lines

Returns contents of a memory PEEK location.

Puts value into specified RAM POKE location.

Tests whether a graphic cell is POINT on or off.

Prints to screen, abbreviation of **PRINT** ? is available.

Moves cursor to specified TAB column.

PRINT @ Print at specified location Reads the next item in a DATA READ

Remark. Erase dot that was SET. RESET

RESTORE Resets DATA pointer.

RETURN Returns computer from a

subroutine. Returns right portion of string. RIGHT\$ Return pseudo random number. RND Executive a program.

RUN Sets a dot at a specified loca-SET tion to a specified colour. Return sign of specified

SGN number. Skips to end of next program

SKIPF on cassette.

Returns sine. Sound specified tone for specified duration. SOUND

Stops execution of program. STOP Converts a number to a string. STR\$

Returns the square root of a SQR number.

TAN Returns tangent.

Converts a string to a number. VAL Quite a powerful Basic for its size isn't it, the following command are not listed in the manual or anywhere else for that matter.

This command has the normal VARPIR syntax of A = VARPTR (B\$) and it works, so I don't know why it was not mentioned.

This command is supported by USR the Basic interpreter though at the moment it is not much use until some technical information becomes available to find out where to poke the entry points. This command also has the **EXEC**

normal syntax of EXEC addr where "addr" is the entry point of a machine language program or subroutine.

CLOADM This command will load a machine language program in-

to memory and has the syntax of CLOADM "filespec" or CLOADM "filespec", addr where "addr" is the position in memory that the routine is to be loaded to.

As far as I could determine the command CSAVEM is NOT supported, (that is unless it has a very different syntax from normal), I tried several variations on the syntax and nothing worked. If that

is the case it would seem that Tandy have been very crafty, you can load a machine language tape but you cannot save one. Now you ask, if that is the case how did I determine that CLOADM works, since there are no machine language programs for the MC-10 at this time.

Well for a start CLOADM does not return a syntax error, it switches on the cassette, clears the screen and prints an "S" at the top of the screen indicating that it is searching. If a BASIC program is encountered it returns an FM error (file mode). If a machine language tape from the Colour Computer is encountered it happily loads in the file name and only fails with an I/O error when the 6809E code is encountered. Which leads me to believe that given a MC-10 machine language file, it would load.

What use are VARPTR, EXEC and USR, well even if you cannot save a pure machine language program, there is no reason why you could not have a BASIC program with machine language poked into the lines with the help of VARPTR or you could have your machine language in DATA statements and poke this into memory and then EXEC to execute.

Video Memory is from 16384 to 16895, other addresses also work in tandem, the reason for this is not understood. Some keyboard addresses are in the region of 16940 and up, for example the address 16952 is used by the space bar and returns a value of 247 when the space bar is pressed, if you write a program where you want something to happen — FOR AS LONG AS the key is held instead of IF the key is pressed then you can read this memory location for the value and if the value is found poke zero into it so that on the next pass, if the key is still held down it will return the original value and if not it will return zero, this procedure applies to the other memory locations in this area.

Blindly poking into various memory locations brought interesting responses that would seem to indicate that with some detailed information higher resolution graphics might be possible. Try poking location 20 (decimal) with different values to see what I mean, (it locks the machine up though and you will have to press the reset button).

Having a Colour Computer here, I thought I could save some typing time by loading a Colour Computer Basic program, I thought I was on to a good thing for a while since the Colour Computer and the MC-10 will both load each other's tapes. However, unfortunately different values are used for the keywords in both machines so what is loaded in has the same line numbers but all of the keywords are swapped around, pity!!

The MC-10 has a DIN socket for a cassette, no cassette cable is supplied, but if you have a Model 1 or a Colour Computer you can use the same cable as

the pin connections are the same. It also has an RS232 DIN socket, this also has the same pin configuration as the Colour Computer.

To sum up, it is a very nice little machine at a reasonable price, the only thing lacking at the moment seems to be

INPUT/OUTPUT

FROM: R.J. Mclean-Formartin, Qld.

I own a System-80 on which I am using a Tandy green screen monitor. At times the display shivers and this makes it difficult to read. However, if a key is pressed (a character entered), or the NEWLINE key is depressed the shivering stops. Would you have any idea of a solution to this problem?

(It sounds like you have an intermittent fault of some sort and you should refer the problem to a qualified technician for repair. - Ed.)

FROM: Mr. G. Whitcher-Yunderup, W.A. It would be helpful if programs that use USR calls were printed with the necessary information to convert from Level 2 BASIC to Disk BASIC for those of us who are too mean to buy the Disk subscription for the sake c. a few programs which may be of interest. I only subscribe to the casette subscription for the ease and not having to type the pro-

grams that interest me.

(Your point is well taken and we would like to include the information needed to modify Level 2 programs with USR routines so that they will work with Disk BASIC but we do not have the time to dissect machine language routines that are only provided in object format or the BASIC equivalent. If the program author would supply commented assembly language source code for the USR routine, we would be happy to publish that along with the program listing and any relevant suggestions for disk users.

RECALL on the disk version of

SOFTPAK is intended to overcome this difficulty in most cases by running the program in the Level 2 environment. However, there are those cases where modifying the program for disk BASIC is the preferred solution.—Ed.)

FROM: Mr. J. Linton-Malabar, N.S.W.

As the SYSTEM 80 is going out of production, is there an alternative expansion system to allow update to disk drive or do I have to buy a SYSTEM 80 expansion unit before they go out of production?

(By now you will probably know the answer to this question as it is discussed in the Editorial. Briefly, MICRO-80 will have expansion inter-faces for the System 80 available about Ed.) the end of February, 1984.

SOFTWARE

AUSTRALIA'S CUP -L2/16K

by Carl Cranstone

Australia recently won the America's Cup which the Americans had held for 132 years. The Australian yacht

"Australia II" broke the longest winningstreak in sporting history by defeating the American yacht 'Liberty' four wins to three. Every Australian can now relive that day (or should I say, early morning!) by playing the Australia's Cup game!!! Up to six people can play and place bets on the outcome of the races. Complete instructions on how to play are included in the program.

HOW TO GET THE PROGRAM **RUNNING(?)**

To get the program 'Australia's Cup' running, those of you who are entering the

program from the magazine will have to follow my instructions below to the letter (or at least to the word!). There are three programs that I have written for this game. The first AUSCUP/LST is the Australia's Cup program in its raw form (i.e. it contains no graphics). The second is AUSCUP/DAT which is a program that creates the program lines that contain the graphics. The third is AUSCUP/LNW which is an LNWBASIC Program to enable LNW-80 owners to see Australia's Cup in colour.

1. AUSCUP/DAT

This program reads in the data for the graphics and POKEs it into memory creating assembled strings. (Exactly the same as those created by Charlie Bartlett's Graphic Assembler program -

issue 5 April 1980).

***STEP ONE: Type in the AUSCUP/DAT program and RUN it

***STEP TWO: delete lines 1 & 2

***type I.IST:— you should see something resembling a garbaged program thing resembling a garbaged program.

Don't worry! This garbage is really assembled strings.

***SAVE or C

CSAVE the strings immediately!!!

2. AUSCUP/LST

This is the program which uses the

strinas * * * STEP THREE: LOAD OR CLOAD the strings and type in this program around the strings. You will notice that lines 1350 and 1560 in this program are reserved for

the strings.

***STEP FOUR: When you have typed

in the program around the strings SAVE or CSAVE it immediately. (This program will now be known as AUSCUP/BAS). WARNING: BE VERY CAREFUL THAT YOU DO NOT ACCIDENTALLY ERASE A LINE WITH AN ASSEMBLED STRING IN IT OR EDIT IT. THIS CAN RUIN ALL OF YOUR HARD WORK!!! YOUR HARD WORK!!!

**STEP FIVE: LOAD or CLOAD the program in and RUN it. The first thing you should see is a large map of Australia. You must press ENTER to continue into the game. If you don't, the game will go into Demo Mode. To start the game you must press ENTE? from the map. If you press ENTER from the Demo Mode, you will return to the map.

3. AUSCUP/LNW

This is for the benefit of LNW-80 owners who want to see Australia's Cup

in colour.

***STEP SIX: Type in the AUSCUP/LNW

program and RUN it.

*STEP SEVEN: Press Break and then

type in the following line: FLS:SAVE"AUSCUP/GRF:d": PLOAD"AUSCUP/GRF:d" where :d is drive number.

This will fill the screen enabling you to see the colour. The /GRF file will be saved and reloaded again so that you can verify that you have a good save.

For those who don't want colour, ror those wind don't want colour, you will have to delete the following statements from the program:
Line 10 'OUT254,0:'
Line 140 'OUT254,116:'
Line 530 'OUT254,0:'

A typical chain file to lead in the

A typical chain file to load in the colour would be as follows:

(Newdos80 2.0 users use CHAINBLD/BAS)

LNWBASIC PLOAD 'ASUCUP/GRF"

CMD"S = BASIC"
RUN"AUSCUP/BAS"

NOTE: AUSCUP/BAS is the resulting pro-

gram when AUSCUP/DAT and AUSCUP/ LST have been merged into one program.

L2/32K Disk

by Bob Wilson

WHAT IS GRAFX?

GRAFX is a tool for use in generating bold titles or graphics for incorporation in programs.

Once you have designed your titles or graphics, GRAFX will write a BASIC program to reproduce them.

INITIAL SET-UP

If you are typing this program in from the magazine, you must first type in the INIT program and run it. The INIT Program creates a disk file called BIGLTRS. This file gives GRAFX the ability to produce the big letters. GRAFX will require the BIGLTRS file to be on disk before it will run; once the INIT program has been run you will not need it again. If you are a disk subscriber you will not need to run INIT as the BIGLTRS file is already on your disk. The INIT program is also on the disk in case you should want to use it.

Make sure you have plenty of free disk space for the programs that GRAFX will write for you. Better still, prepare a disk containing only your operating system, GRAFX and BIGLTRS and initialize your AUTO command as BASIC RUN''GRAFX''.

If you use NEWDOS 80 Ver 2 as your DOS you can run the program as it is. If you use another DOS, you will need to delete the last statement from line 80 of the program. The statement to delete is CMD"F", DELETE 10-70

Your Disk is now ready to run GRAFX on power-up or RESET.

USING GRAFX

Power-up or RESET with your GRAFX Disk in Drive 0.

GRAFX will grab as much of your memory as possible for use in string manipulation when it writes programs. It will do this calculation for itself. The program writing operation will take longer on a 32K '80 than on a larger machine, because the string area management functions (when string space becomes full) will operate more often.

Fifteen lines of your screen will be available for you to use in designing your titles or graphics. The bottom line is used for prompting you and to advise you of the current mode of operation.

After the initialization routine, the program will display the COMMAND MODE prompt line on the screen.

GRAFX COMMANDS

In COMMAND MODE the prompt line displayed is:

(C)lear (G)rafx (H)uge (S)lave (R)ecall (P)rogram (E)nd

The appropriate letter (CGHSRP or E) will select the various functions:

GRAFX mode In GRAFX MODE you have several options available: (C)ursor Mode

> Use the arrow keys to move the cursor

(D)raw Mode

: Use arrows to draw lines

(E)rase Mode (T)ext Mode

: Use arrows to erase lines

Enables text to be entered starting at the current cursor position

e(X)it

Returns you to COM-MAND MODE.

HUGE LETTERS MODE:

Enables HUGE letters to be entered for titles.

Screen capacity is 80 characters and the Character Set available is: ABCDEFGHIJKLMNOPQRSTUVWXYZ 123456789!?;;,.

NOTES

Input always starts at the top left of the screen.

If you reach the bottom of the screen, the top line will be scrolled off the screen and lost.

The screen will be cleared on entering this mode. Enter HUGE LETTERS BEFORE entering GRAPHICS.

To exit this mode enter SHIFT/ BACKSPACE.

SAVE and RECALL MODES:

On selecting either of these modes you will be asked for a screen number.

The screen contents (15 lines) will be SAVED to, or RECALLED from, the screen memory you select and you will be returned to command mode.

PROGRAM MODE

You will be asked for one letter to be included in the FILESPEC. Your letter will appear as the 'x' in the following

TITLEx/GFX

A BASIC program will be written to reproduce the current screen constants, and will be dumped to disk in ASCII format.

The program created will contain 4 lines which will create and print a series of strings from data contained in the subsequent lines.

The END command terminates the running of GRAFX.

SOURCE UTILITY Model 3 Disk

by T. Domigan

SOURCE/BAS is a program to transfer EDTASM source files between tape and disk for Model 3 users of NEWDOS80 V2.0.

APPARAT discontinued support for Tape I/O in EDTASM for the Model 3 as they were concerned with the unreliability of tape. Whilst object code can be moved between tape and disk with LMOFF-SET, source files cannot. SOURCE/BAS fills this gap and also allows the copying of source tapes.

To use SOURCE/BAS enter the command "BASIC IV" from DOS. This special command is necessary as a nonstandard logical record length is used to get the code from disk. Once you have entered BASIC, "RUN" the program.

The machine language section resides in the bootstrap stack area and therefore does not require memory size to be set. However, memory is protected by the program in line 20, from 8000H to F000H for the storage of up to 26K of text.

This program is fully-menu driven and is self-explanatory.

Tape I/O can be made at high or low speed as desired. Disk I/O will tend to be slow so have patience with large files.

Always exit the program via menu option 6 as this ensure's that the disk file is closed and BASIC is correctly restored.

LVAR L2/32K

by Tim Fish

This is an extremely useful debugging tool for BASIC programs. The program resides at the top of memory but, on first being run, it initialises the DOS exit for the Disk BASIC verb NAME to a jump instruction to its own start address. Type NAME from ROM BASIC now, instead of giving you an L3 ERROR, gives you a list of all the single precision, double precision, integer and string variables used in your program and their values. So when your BASIC program fouls up press BREAK (if necessary) and type NAME. The variables are displayed in "pages" of 15. Press any key for the next page. Array variables are not listed.

LOADING INSTRUCTIONS: MEMORY SIZE 32320 SYSTEM *? LVAR

*? /ENTER or /32321

> - load your BASIC program (tape contains a daft demo program)

RUN ENTER

... (BREAK) NAME ENTER

TRACK RACER Hitachi Peach

by D.C. Kelly

In this race game you must steer your racing car down the track while avoiding the oncoming cars. You will crash if you run off the track or hit an oncoming car. The further you travel the greater your score. You steer the car using the left and right arrow keys. After you have crashed the program will display:

CRĂSH INS = PLAY AGAIN

DEL = FINISH

If you want another game press the INS key, otherwise press the DEL key.

HI-RES TEXT **Colour Computer**

by Geoffrey D. Williamson

One of the most annoying features of the CoCo is its lack of a true lower case display. It does not take too many hours in front of the monitor to become thoroughly annoyed with Tandy's excuse for lower case!

Unfortunately, this is fixed by hard-ware, and one may resort to alternative hardware lower case drivers to overcome this problem. Alas, these are expensive; yet there is a cheap way out of this dilemma, thanks to MICRO-80; Just type in the following program and you will be able to have true upper and lower case on the screen at the same time. Not only that, but this text is usable at the same time as graphics -- here come some graphic adventures!!

One final feature of this program is its relocatability — by this. we mean it can live anywhere in memory quite happily, as it is written in position-independent code which is much easier to do on the 6809 than most 8 bit microprocessors.

Because of this relocatability you

can 'hide' the machine code program behind the BASIC program -- this is achieved by a little driver attached to the program proper. The advantage of all this is that once the whole program is set up, it can ALL be loaded with one (C)LOAD, as if the machine code where not there

This program is fully compatible with disk systems and 16K or 32K of memory. With it, you can use the PRINT@ command as you would on the text screen normally if the graphics screen is PMODE

You can also use it with any start page, and there are some interesting effects in the coarser PMODE's - how about video titles using PMODEO or 2?
However, the PRINT@ statements

will not work normally except in PMODE 4. If you crash out of the program abnormally, and are still on the graphics screen, iust type A = USR1(0) to get back to the text screen.

Type in the demo BASIC program - it is certainly simple, but does give you an idea of what is possible.

PROGRAM DESCRIPTION

As the program is written in machine code it is very fast, and you would be hard up to find any slow down from that of the BASIC interpreter acting

normally.

The source code is well commented and the remarks here are only in-

tended for amplification.

The source code from line 120 to line 270 is all for relocating the machine code invisibly behind the BASIC program invisible to the BASIC interpreter that is. Once that relocation is done the loader is dispensed with — in fact, it cannot be re-used — see line 250.

Lines 330 to 550 are for keeping

tabs on the USR calls from the BASIC program. There is provision for two USR calls. The first (USRO) turns on the graphics display, and the second (USR1) turns it off. The code in this section is there to make sure that all errors from errant BASIC programmers are properly trapped!

The main code starts at line 610, and is commented extensively in the listing. You will note that no control characters are allowed in the listing, but these could be easily added if yo uwished to work out their parameters for the look up table.

SET UP

1. Take very careful note of the addresses in the object code in the first twenty or so lines of code. If you are using Tandy's EDTASM+ to assemble this program you MUST force the assembler to use the direct page mode of addressing by using the < symbol. If you do not, the assembler will default to extended page addressing. This will slightly slow the code down, but more importantly, the addresses I have given in the demonstration program for the USR calls (and for the loader program) will be incorrect.

There is nothing sacrosanct about the values in the program, but be prepared to spend a fair bit of time in debugging if you do not stick slavishly to them!

- Once you have the machine code safely assembled (and backed up) CLEAR some space at the top of RAM - if you have 16K try CLEAR200,&H3000 CLEAR200,&H7000 for 32K. (C)LOADM the machine code into this area with the APPROPRIATE OFFSET. Remember, it is ORG'd at zero. If you forget the offset, you will bring down your whole system!
- Now that the machine code is safely tucked away in protected RAM you can load in your BASIC program. Once you are happy with the latter you can go to the next step.

- 4. EXEC the machine code program. This places it behind the BASIC program and the WHOLE program can now be (C)SAVE'd like a normal BASIC
- Program.

 5. RUN you new creation I hope it works!!

THE KILLER SATELLITE (COLOUR)

by Scott Edwards

"The Killer Satellite" is an original action game for the 16K, extended basic. colour computer. It should run oin all colour computers with extended colour basic

A war satellite in space has mal-functioned and is sending its deadly cosmic rays at Earth. You must protect Earth by destroying these rays until the

satellit runs out of energy.

The cosmic rays are represented by a random sequence of coloured squares, all rapidly approaching your ship. The "colour" of your ship can be varied by pressing the space bar. By matching the colour of your ship to the components of the beam, portions of the beam (or ray) can be destroyed. If you destroy the whole ray, you go to the next level where a new ray moves faster. If the deadly beam reaches your ship, you are destroyed.

To begin the game you have 3 ships, and extra ships are obtained as you

progress through the various levels. If all of your ships are destroyed before the satellite fails, the satellite destroys the Earth and you lose. On the other hand if you can protect the Eart for 11 rounds, the satellite runs out of power and the Earth

is saved. All this makes for an entertaining game which becomes quite difficult at the higher levels. For added interest a score is displayed at all times. If a ship is destroyed you continue on the same level until you are successful or otherwise.

To use the program simply type RUN, read the introduction, then hold down any key until the game begins. From then on simply use the spacebar to match the colours - Good Luck.

The functioning of the program is

explained below: Line 60, 70:

Generate initial display

Line 90, 100:

Generate the strings for the number of ships left, and the colour sequence of your ship.

Lines 110, 120:

Complete initial display

Lines 130-150: Print scenario

Lines 160, 170, 180:

Flash screen, wait for continue

Line 200:

Initializes variables Line 210:

Go to round generation Lines 240-290:

Loops for colour mate between ship and ray by using INSTR (), then uses the MID\$ () functions availble in BASIC to manipulate the ray string.

Lines 310, 320:

Update display, and makes sound effects.

Line 340:

If 1st character of A\$ = blank, ray is destroyed, you win this round.

Line 370: Update variables, if ray at your ship you lose round.

Line 390:

PAGE 16

Go to beginning of loop - continue round.

Lines 420-480:

Check for spacebar being pressed, and change ship colour, if necessary. Also controls speed of

Line 500:

rounds then you've won, otherwise

If 5 successful rounds, get extra

Print satellite

Print score, print round, generate

Time delay and colour sequence.

If last ship you lose

Lines 600-680:

You lost, wait for key.

Line 690, 700:

Another Game?

Line 720:

You Won.

Variable List:

Cosmic Ray A\$

В\$ Colour sequence of ship Displayed portion of A\$ (usually) Q\$

Position of left portion of Q\$ on

SH Number of ships

R Number of rounds M Score

G, SV, S

Determines speed of ray S1

Used to determine when to get new ship

Ε Length of Q\$

С Determines colour of ship

Y1, X1 Position of starts

T, ZZ, V Z.

Variables used for - next loops. N.B. The use of INSTR\$ (use of INSTR\$ () and ., both functions of extended BASIC allow this program to run at a reasonable speed. Therefore this program would be difficult to modify for computers without these special string handl-

ing routines.

HOUSEHOLD ACCOUNTING VER 4.2 & VER 5.0

This is an all new version of the earlier Household Accounts program published in MICRO-80 magazine. Input has been simplified, all bugs eliminated and, the program will load and save to disk or tape as required. The program will carry out many of the bookkeeping functions for a small business.

The program is written in BASIC. Simply position the tape to the start of the

program, type LOAD, press RETURN and press the PLAY key on the recorder. The program will then load. When loaded, type RUN and press RETURN. The Household Accounting copyright message will be displayed together with the program menu.

FUNCTIONS

The following MENU is displayed when the program starts:

HOUSEHOLD ACCOUNTING VER 4.0 M I C R 0 - 8 0 PTY **张** 张 (C) 07/07/83 LTD

MENU

•

= KEYBOARD INPUT

= READ 'EMORY

4 = EDIT MEMORY

General Journal

5 = SAVE DATA

6 = PRINT JOURNALS

8 = LEDGER ACCOUNTS

= Sales Journal SJ

Input to the numeric field of DEBIT and CREDIT must have leading zeroes, or blanks.

7 = LINEPRINTER UTILITY

i.e. enter:

\$10.10 as 00010.10

\$10.01 as 00010.01 \$1.10 as 00001.10

\$101.10 as 00101.10 When all fields have been filled the

program will respond with:

CORRECT (Y/N)

If 'N', the program will return you to the start of input for that record. If 'Y', the program, will respond by going to the next record. To return to the menu press RETURN in response to the DATE field

2. LOAD DATA

This function enables you to load a complete set of data. The program will display a menu giving you the choice of loading from cassette or disk, or of returning to the main menu should you have selected this function by mistake.

For either type of load the program will request an 8 character filename. In the case of a disk load the program will search all available drives for the file starting with

In the case of a cassette load the program will read in the name of the first file found on the tape, if this does not match the filename you supplied the program will display the filename read from tape and abort the function.

After a successful load from either disk or cassette the program will return to the LOAD MENU.

3. READ MEMORY

This function scrolls ALL data stored in memory, up the screen.

4. EDIT MEMORY

This function is used to add new records, or to change the data stored in any one record. It uses the same input and display format as the keyboard input mode except that it gives several extra options:

Respond to the prompt SELECT

with one of the following:
This will put you into edit mode. The input format is the same as the Keyboard input function EXCEPT that this time if the RETURN key is pressed at the start of an entry field, that field will remain unchanged and input will move to the next field.

This will increase the record count by one and display the next record.

This will increase the record count by ten and display a higher record.

This will decrease the record count by one and display the preceding record

This will decrease the record count by ten and display a lower record.

RETURN in response to the SELECT * prompt will return you to the main menu.

5. SAVE DATA

This function enables you to save a complete set of records. The program will display a menu giving you the choice of saving to cassette or disk, or of returning to the main menu should you have selected this function by mistake. For either type of save the program will request an 8 character filename, write the file and return to the SAVE MENU. (You should make a note of the filename you use, particularly when saving to cassette, as the program requires the name when you wish to reload the data).

6. PRINT JOURNALS

This function enables you to print the four journals to the screen and to a printer (optional). Follow the instructions on the screen. Note: Do not attempt to use the printer option unless there is a printer connected to the computer. Pressing RETURN in response to the DATE prompt will cause all dates for that journal to be printed.

IMPORTANT NOTE

Before the Ledger Balances are calculated and printed, the records in memory are sorted according to Account No. This destroys the normal DATE-order sequence of the record in memory, which is the preferred order for all other printouts. Make sure that you SAVE a copy of your data before using this function.

7. LINEPRINTER UTILITY

This function allows direct interbetween the keyboard and the printer, i.e. whatever is typed onto the screen will be printed as soon as the RETURN key is pressed. This utility is useful for setting up headings on reports. Note: Do not attempt to use this function unless there is a printer connected to the computer.

New round, if you complete 11 generate stars.

Line 510:

ship.

Line 520:

Line 530:

rav.

Line 540:

Line 560:

Print remaining ships.

Line 580:

Destroy ship, same round again.

Line 590:

LOADING FROM CASSETTE

= LOAD DATA

1. KEYBOARD INPUT This function is for the input of

data and starts from record 1 and works up to the maximum record number for your system. Re-entry to this function when data is still resident in memory will cause the program to resume at the next record after your last entry (this also applies where a file is loaded from disk or tape). Your input is displayed next to the request for details. The cursor is displayed at the point where your entry is going to take place. The asterisks in each input field indicate the maximum number of characters that the field will accept. When a field has been filled, your input will move to the next field. You do not have to fill each field. When you have entered the information you require simply press RETURN and the program will move on to the next field. The only exception to this is the first input of DATE **/**/** If RETURN is pressed in response to the first input field the program will return you to the menu.

The field "PREFIX" is used to indicate to the program the ledger into which the record is to be placed. This should be one of the following:

= Cash Payments Journal CR = Cash Received Journal

8. PRINT LEDGER ACCOUNTS

This function allows you to print the ledger accounts to the screen and to a printer (optional). Follow the instructions on the screen. Note: Do not attempt to use the printer option unless there is a printer connected to the computer.

USING THE PROGRAM

The program has the capacity to handle both single entry and double entry accounting systems. The benefit of the double entry system is that it provides a checking mechanism to indicate accuracy of input and processing and is the preferred system in maintaining financial records. However, the double entry system uses more records in recording the data thereby reducing the total capacity available for recording transactions.

For the purposes of this illustration the double entry system has been used.

Prior to using the program, it is necessary to establish a Chart of Accounts to accumulate transactions appropriate for the purpose of recording. Adequate allowance has been made for the number of ledger accounts (998) that may be used. The following example has been used to illustrate how the program can be used to record personal income and expenditure.

CHART OF ACCOUNTS Balance Sheet of Items Assets

- 1. Land
- 2. Buildings
- 3. Household Furniture & Appliances4. Motor Vehicles
- 6. Public Co. Shares
- 7. Bank Accounts

Liabilities

- 11. 1st Mortgage12. 2nd Mortgage

- 72. Household Repairs
- 73. Housekeeping
- 74. Insurance
- 75. Motor Vehicle Costs 76. Subscriptions Interest paid
- 78. Health Insurance

Taxation Deductions

- 81. Education82. Medical Costs83. Rates & Taxes

Trade Subscriptions

- To commence processing the transactions shown in the example the open-
- ing balances need to be entered. This is done via the keyboard input. For this purpose the General Journal (GJ) prefix is
- used.

(N.B. The print out of the General Journal processing demonstrates the self checking mechanism of the double entry

system in showing that the total of debits and credits agree and that there is no imbalance. If a figure other than \$0.00 is

shown as the balance this indicates an error in processing has occurred and requires investigation and editing).

CASH RECEIPTS JOURNAL

CASH RECEIVED	JOURNAL FOR ALL	(DATE)'S

TOTAL			47046 46	17016 16
TOTAL			13910.60	13910.60
BALANCE	\$0.00-			

Normally for each receipt an entry is required to the Bank Account (debit entry) and the ledger account to record the nature of the income (credit entry). In this example only one entry has been made to the Bank Account for the total of the records processed. This has been done to demonstrate a wav in which maximum availability of records can be maintained. To carry out this function return to the menu and select the "Print Journals"

CASH PAYMENTS JOURNAL FOR ALL (DATE)'S

function and list the transactions to obtain the total of the input. Once obtained, return to the "Keyboard Input" function and process this total to the Bank Account using the "CR" prefix.

The comments noted above for Cash Receipts also apply here, except that the entry to the Bank Account for cash payments is a credit and entries to the expense accounts, etc. a debit.

099	0.00	64225.16	64225.16-
TOTAL	167374.48	167374.48	0.00

This facility summarises the balances of all active ledger accounts showing the total debit and credit entries and the balance of each account. Validation of the processing is ascertained when the total debits and credits are the same amount and the total equals 0.00. If the total does not equal 0.00 an imbalance has occurred which requires checking and correction.

Normally, each of the four journals would be individually checked prior to performing a trial balance to ensure that each journal is itself balanced. The trial balance is then merely a formality and should show no imbalance.

IMPORTANT NOTE

Before the Ledger Balances are calculated and printed, the records in memory are sorted according to Account No. This destroys the normal DATE-order sequence of the records in memory, which is the preferred order for all other printouts. Make sure that you SAVE a copy of your data before using this function.

LEDGER ACCOUNTS

This function enables each individual account to be printed showing all the transactions processed to that account. For the purposes of illustration the Bank Account (#10) and the Interest Paid Account (#77) are listed below.

To obtain a complete print out of ledger accounts it is necessary to input each account number in response to the "Which Account Number do you require" question.

In cises where the record maximum is reached this can be overcome by obtaining a print out of all journals and ledger accounts for retention as a permanent record and repeating the procedural functions outlined above.

This commences by clearing the memory and inserting the closing balances for each ledger account via the General Journal prefix.

The program provides great flexibility as to the types of accounts that may be incorporated into the chart of accounts. Your requirements can be specifically designed for your own particular circumstances. The design and allocation of account numbers should be thoughtfully considered prior to commencement as any subsequent change in account numbers for particular purposes will require the editing of prior transactiuons to accounts affected.

SALES JOURNAL

The Sales Journal will often not be applicable in the normal household situation. It is, of course, useful for a small business

Version 4.2 has been modified to run on the Hitachi Peach.

Version 5.0 has been modified to run on the TRS-80 Model 4.

Instructions for the Model 4 version are the same as those for the Hitachi Peach, the program has however been further modified to make use of the Model 4 features: the description field has been expanded to 31 characters and the program has been broken up into modules to gain maximum use of the memory. Model 4 owners should type in each module from the magazine and save it to disk as an ASCII file using the filename that is listed in the module, ie:

"MODULEO/BAS",A SAVE

When the program is run, MODULEO must be the first program that is loaded and run, this module initializes the sytem. The program will load the other modules as required.

Model 4 users should ignore any references in the main text to cassette I/O, these functions are not supported by your machine. Model 4 owners MUST be in the Model 4 mode to run this program.

BOLD PRINTING ON LINE PRINTER VII

This 1 line subroutine which enables owners of a Lineprinter VII to use bold type. The subroutine may also work on other Printers, but I have not tried

To use the subroutine, simply LPRINT your normal text, and when you want to use bold type, put the tex in P\$ and use GOSUB 1000 (or wherever you put the subroutine). The text must not go over on to the next line, or an error will result. On returning from the subroutine, the Printer's carriage will be placed just after the last character of P\$. The routine will work in normal and double size Print mode, but if both are mixed on one line, problems will result.

The subroutine works by simply printing P\$ in the same place three times. The control code 26 executes a carriage return with no line feed. ZS\$ is a string of blanks, which will return the carriage to the start of P\$ after each carriage return. ZP is used to check that P\$ will fit on one line and to calculate the length of ZS\$. If you want the bold type darker, increase the length of the FOR . . . NEXT loop.

SIRIUS ADVENTURE for the Colour Computer and Hitachi Peach

This Adventure was originally written to run on the Model 1.

It has mainly been converted to take advantage of the HI-RES WRITER published elsewhere in this issue. If you are typing this program in from the magazine, follow the instructions for merg-ing the HI-RES WRITER with this program and then save it. If you have a cassette subscription you only to load the program and the HI-RES WRITER will load into memory as well.

The adventure is fairly small by normal standards, though it will still provide you with a challenge. The Hitachi Peach version is essentially the same program, but without the need for the HI-RES WRITER. As is usual with Adventures, no further clues to its operation will be given here, you'll just have to sweat it out!!!

SPACE UTILITY DISC BASIC by D. Bereis

This utility will go through a Basic program and insert spaces around all of the keywords, this not only makes the listing easier to read on a Model 1, but if you have purchased a Model 4 and still have your Model 1 it will be essential if you want to convert your old Model 1 programs, since the Model 4 WILL NOT run a program that does not have spaces between the keywords. Using this utility will save you hours of typing. To use it simply your Basic program then type: CMD"S

Then type:

SPACE and press ENTER/NEWLINE

Then type:
BASIC * and press ENTER/NEWLINE Then save the program. If you have a Model 4, all you have to do now is put the disk in your Model 4 and run the conversion program on it. Remember you will still have to check for things like PEEK's and POKE's before you run it.

YAHTZEE L2/16K by T. Domigan

YAHTZEE is based on the popular poker-like 5-dice game of the same name.

AIM

The aim of the game is to score in each of 13 categories and the winner is the player with the highest total score.

ROLLING THE DICE

Each player is allowed 3 rolls of the dice to maximise the score in each of the 13 turns. The first roll changes all 5 dice whilst the remaining 2 players allow selective rolling of any of the 5 dice, e.g. if Rolls 1 gives 4, 3, 6, 1, 4, to maximise the score by rolling more 4's, then "R234" would be suitable. If a good score results after the first or second roll then you may immediately score by entering "S" instead of "R". When scoring it is only necessary to enter the category number e.g. 13.

SCORING

Categories 1-6: Sum of that category dice in hand. Category 7: 3 of a kind. Score total of dice.

8.4

9: Full house. . . 25 pts

10: Small Straight (sequence of 4 dice) 30 pts

11: Large Straight (sequence of 5 dice) 40 pts

12: YAHTZEE (5 of a kind)score 50 pts 13: CHANCE = anything

score sum of dice If a second or later YAHTZEE (5 of a kind) is scored and the appropriate category 1-6 has been filled, it may be used in categories 7-11.

Sound is available but memory need not be protected as the m/l will reside in the REM statement of line 10.

NOTE: Although written for a Model 3, this program will run on a Model 1 without modification.

SPACE INVADERS for the TRS-80 MC-10

This short Space Invaders game is included in case any of you have bought an MC-10 for Christmas, the program is short and simple, (out of necessity due to the limited memory). To move your laser cannon left and right press the "A" or the "S" keys respectively these keys keys respectively, these keys were chosen because they have the left and right arrow symbols on them as well. Press the Space Bar to fire. Ten points are given for each Invader that is destroyed. If you shoot all the Invaders before they land you get a bonus of 30 points. If any Invaders land, you lose.

П

EXT MONTH'S ISSUE

Next month's issue will contain at least the following programs plus the usual features and articles. An (80) after a program title indicates that the program will be for TRS-80 Model 1/3 or System 80/Video Genie. A (CC) indicates that the program will be for the TRS-80 Colour Computer and (HP) that the program is for the Hitachi Peach.

CRICKET (CC)

Join in the Summer fun and play your own World Series Cricket on your COCO. Complete with batsmen, bowler and fielders. A game for two players.

ALIEN CHASE (HP)

Another "get them before they get you" game for Peach users. You pursue the Aliens around the screen and are in turn pursued by them.

AUTOMATIC DIRECTORY (80) - 32K DISK

Some of the newer DOS's have a facility to speed up file manipulation from the Directory. AUTOMATIC DIRECTORY gives you this facility from earlier DOS's. You may KILL, LOAD or LIST a file simply by placing the cursor against that file name on the DIRectory display and pressing the appropriate key. In addition, you may assign keys to particular files so you may load such a file with a single keystroke.

DISK DIRECTORY RECORDER (MODEL 3)

About the time you start on your second box of diskettes, you run into the problem of keeping track of all those files. It seems a shame to use pen and paper to do this when you have a perfectly good computer there. Disk Directory recorder stores a sorted catalogue of all files showing the name of each file, its extensions and the name of the disk on which it may be found. It is thus a simple matter to update your catalogue as you add and delete new files.

FILM COSTING (80) L2/16K

Whilst we do not expect too many of our readers are involved in processing large quantities of photographic film, this program which calculates processing costs does illustrate some interesting programming points and could probably be adopted to a variety of similar uses.

The cassette edition of MICRO-80 contains all the applicable software listed each month, on cassette. For machine language The cassette edition of MICHO-80 contains all the applicable software listed each month, on cassette. For machine language programs copies of both the source and object file are provided. All programs are recorded twice. Level 1 programs can only be loaded into a Level 2 machine if the 'Level 1 in Level 2' program from the MICRO-80 Software Library — Vol. 1 is loaded first.

Note: System 80/Video Genie computers have had different tape-counters fitted at different times. The approximate start positions shown are correct for the very early System 80 without the volume control or level meter. They are probably incorrect for later machines. The rates for a cassette subscription are printed on the inside front cover of each issue of the magazine. The disk edition contains all applicable programs which can be executed from disk. Level 1 disk programs are saved in NEWDOS format. Users require the Level 1/CMD utility supplied with NEWDOS + or NEWDOS 80 version 1.0 to run them.

SAVE A PACKET ON MICRO-80's DISK DRIVE PACKAGES FOR TRS-80 MODEL 1 AND SYSTEM 80 MICROCOMPUTERS

DUAL DRIVE PACKAGE from ... \$874

Bigger volume means lower cost price, which we are passing on to you. Avoid the annoying bundle of cables, wires and separate boxes. MICRO-80 is now offering our well-proven MPI disk drives in attractive, self-contained single or dual-drive cabinets complete with internal power supply. Our drive Ø and dual-drive packages also include the appropriate version of DOSPLUS and dual-drive cable.

> The best news of all is the specially reduced package prices ... SAVE \$23 - \$107 over our already low prices!

Choose the appropriate system from the table below:

DRIVE TYPE	No. of Tracks	No. of Heads	Capacity	Dosplus Version	Price	* Saving
DRIVE Ø						
1 x MPI B51	40	1	100K	3.4	\$499	\$137.95
1 x MPI B52	40	2	200K	3.4	\$639	\$97.95
1 x MPI B92	80	2	400K	3.4	\$799	\$107.95
DRIVE 1					·	·
1 x MPI B51	40	1	100K	_	\$415	\$33.00
1 x MPI B52	40	2	200K	_	\$525	\$23.00
1 x MPI B92	80	2	400K	_	\$695	\$23.00

^{*}Represents the saving compared with buying all the items included in the package separately

If it's a dual-drive system you need, then take advantage of our dual-drive package and SAVE a further \$40 on the price of two single-drive packages ...

DRIVE TYPE	No. of Tracks	No. of Heads	Capacity	Dosplus Version	Price
2 x MPI B51	40 ea	1 ea	2 x 100K	3.4	\$874
2 x MPI B52	40 ea	2 ea	2 x 200K	3.4	\$1125
2 x MPI B92	80 ea	2 ea	2 x 400K	3.4	\$1454

Dual-drive package includes two bare disk drives, self-contained dualdrive cabinet/power supply as illustrated, two drive cables and the version of Dosplus indicated.

NOTE: All 40 track drives are completely compatible with 35 track operating systems such as TRSDOS. DOSPLUS allows you to realise an additional 14% capacity compared with TRSDOS. Under DOSPLUS 3.4, 80 track drives can read 35/40 track diskettes.

All disk drive components are still available separately:

BARE DRIVES — MPI drives offer the fastest track-to-track access time (5 milliseconds) available. All drives are capable of operating in double density for 80% greater storage capacity.

MPI B51 40 track, single-head, 100K MPI B52 40 track, dual-head, 200K MPI B92 80 track, dual-head, 400K Separate, dual-drive power supply	Price \$349 \$449 \$619 \$85	Freight \$5.00 \$5.00 \$5.00	Self-contained, single drive cabinet/power supply Self-contained, dual-drive cabinet/power supply Two drive cable Four drive cable	\$99 \$135 \$39 \$49	\$5.00 \$5.00 \$2.00 \$2.00
--	--	---------------------------------------	--	-------------------------------	--------------------------------------

Prices are FOB Adelaide. Add \$5.00 freight for single drive package, \$10.00 for dual-drive package. Prices are in Australian dollars. Freight is road freight anywhere in Australia.

All items carry a 90-day parts and labour warranty. Repairs to be carried out in our Adelaide workshops.

[•]Drive Ø package includes one bare disk drive, self-contained singledrive cabinet/power supply as illustrated, two drive cable and the version of DOSPLUS indicated.

[•]Drive 1 package includes one bare disk drive and self-contained single-drive cabinet/power supply as illustrated.

MICRO-80

LEVEL 2 ROM

ASSEMBLY LANGUAGE TOOLKIT

by Edwin Paay

FOR TRS-80 MODEL 1, MODEL 3 AND SYSTEM 80/VIDEO GENIE

This is a new package consisting of two invaluable components:

- A ROM REFERENCE Manual which catalogues, describes and cross-references the useful and usable ROM routines which you can incorporate into your own machine language or BASIC programs.
- •**DBUG**, a machine language disassembling debugging program to speed up the development of your own machine language programs. DBUG is distributed on a cassette and may used from disk or cassette.

Part 1 of the ROM REFERENCE manual gives detailed explanations of the processes used for arithmetical calculations, logical operations, data movements etc. It also describes the various formats used for BASIC, System and Editor/Assembly tapes. There is a special section devoted to those additional routines in the TRS-80 Model 3 ROM. This is the first time this information has been made available, anywhere. Differences between the System 80/Video Genie are also described. Part 1 is organised into subject specific tables so that you can quickly locate all the routines to carry out a given function and then choose the one which meets your requirements.

Part 2 gives detailed information about each of the routines in the order in which they appear in the ROM. It describes their functions, explains how to use them in your own machine language programs and notes the effect of each on the various Z80 registers.

Part 2 also details the contents of system RAM and shows you how to intercept BASIC routines. With this knowledge, you can add your own commands to BASIC, for instance, or position BASIC programs in high memory — the only restriction is your own imagination!

The Appendices contain sample programmes which show you how you can use the ROM routines to speed up your machine language programs and reduce the amount of code you need to write.

DBUG: Eddy Paay was not satisfied with any of the commercially available debugging programs, so he developed his own. DBUG: allows you to single-step through your program; has a disassembler which disassembles the next instruction before executing it or allows you to bypass execution and pass on through the program, disassembling as you go; displays/edits memory in Hex or ASCII; allows Register editing; has the ability to read and write System tapes and all this on the bottom 3 lines of your screen, thus freeing the rest of the screen for program displays. Four versions of DBUG are included in the package to cope with different memory sizes.

The best news of all is the price. The complete Level 2 ROM ASSEMBLY LANGUAGE TOOLKIT is only:

Aus. \$29.95 + \$2.00 p&p
 UK £18.00 + £1.00 p&p

SPECIAL OFFER TO OWNERS OF THE LEVEL II ROM REFERENCE MANUAL ...

UPGRADE TO THIS ASSEMBLY LANGUAGE TOOKIT FOR ONLY \$19.95!

Send back your original Level II ROM Reference Manual plus a cheque, money order or Bankcard authorisation for \$19.95 plus \$2.00 p&p and we will send you the new ASSEMBLY LANGUAGE TOOLKIT

MICRO-80
